Actually, these shouldn't be significant. The fingerprint is primarily
the result of the PLL synthesizer settling down (crystal oscillators
also vary in frequency a little bit, but not like a PLL during lock-up).
If the radio isolates the VCO/PLL from the load decently (and most
do), then SWR/reactance/impedance should have essentially no influence.
Also, the PLL/VCO are probably running off regulated voltages, so
power supply variation should have little influence on the PLL
lock-up waveform.

>One of my rigs is an HTX-202 (like 10,000) others out there. What do you
>think would happen to the fingerprint if I ran on batterys, weak batterys,
>12v from the car, on 13.8 with a smidge of ac ripple? Hi power,
>low power, an antenna with high swr? Duck? An antenna with a capacitor in
>series, started to tx while holding the antenna with my hand then releasing
>it? When the radio is cold?

I don't believe any of these conditions are likely to have a significant
influence on the PLL characteristics, and, therefore, the fingerprint.

>I would think that the fingerprints would be quite unstable unless you always
>used the same exact antenna, voltage, temp, location...

Fingerprints aren't black magic, and they're not influence by just
anything. My entire point in this thread is understanding which
things matter and which ones don't.

I was avoiding going into a lot of detail. Of course you are correct in that
the TxID-1 does not "read" any amplitude information, and is absolute by any
interpatation, but it is a GOOD tool to hope "prove" abuse by a given user.

Additional information like DF'ed location, attenuated readings (lots of
signal strength with attenuators in front of the guys house), recordings
(TxID-1) of the same trasnmitter when properly used (talking with ID/callsign)
are all inporatant pieces.

Also tools like APRS to let multiple stations plot a signal bearing and share
the data "quickley" over packet can also be of greate use.

The problems in Kansas are, sigh, not unique. I can tell you that the same or
similar problems exist in the Balt / Wash area as well. It is unfortunate
that we must spend time dealing with these issues, but they do keep coming
back.

We are also istalling seperate doppler type direction locators at all of our
recieve sites (12 +) and will be able to "localize" via the basic system
before real DF work with beams and similar comes into play.

Well, I suppose the mic-preamp also gets power from the +8V, but there
is a DTMF encoder in the microphone, too. There's no spec in the
IC-2000 manual for maximum current drain.

The up/down line is connected directly to an analog input on the uP,
and there is a 4.7k pull-up resistor; I don't think this will be
much use with a 470 ohm pull down. I tend to believe the voltage
is supplied by the microphone in this case, and I'll measure it
sometime and update the FAQ, unless someone meaures it first and
lets me know.

Thanks for the note, Gary!

This is exactly how it works, Dana. I have the schematics for all
the Icom mikes, and have repaired more than a few. Trust me, hard
to ground for UP, to ground through a 470 ohm resistor for DOWN.
No voltage is sourced on this line by the microphone. It should
be simple enough for you to test this. Short the pin to ground,
the radio steps UP, short the pin to ground via a 470 ohm resistor,
the radio steps DOWN. Apply external voltage to this pin at your
peril.

2181. need driver circuit diagram for Icom 720A

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-11 00:00:00 UTC
From: wa2ise@netcom.com
Message-ID: <wa2iseDMLAL8.8rq@netcom.com>
Source record: 205770

Recieved in the snail mail from Cuba (of all places!) a request for the schematic for the driver stage of an Icom 720A transciever. Seems that the Cuban ham was given this radio a few months ago, but is missing the driver stage. He homebrews stuff, so he wants to build a replacement circuit, but needs a copy of the schematic so he will know what to build.

Can someone send me a copy of the diagram of the driver stage (and if it's not too much trouble, the rest of the diagram of the radio) and I'll pass it on to him. I'm good in the callbook.

Date: 1996-02-11 00:00:00 UTC
From: kovar@zeus.ia.net
Message-ID: <4fk4rt$cum@hera.ia.net>
Source record: 205773

I have a pair of Brown Bro Paddles that got dropped and would
like spare parts to fix it if anyone can help me.
The model number is BTL-A.
I have never been happy with any other paddles.
I use these paddles on the air and wish someone would sell me one of their
Browns that just sit on their shelf.
I do not care if they are scratched up. Just need a good working set.
In my mind it makes me mad that some people collect these and never use
them.
The next best bet is a HAM KEY. If someone has a Ham Key paddle that no
longer needs it, I think it is a copy of the BROWN. It may work fine too.

Thanks,

Jack Kovar

FOR SALE FOR SALE FOR SALE FOR SALE FOR SALE FOR
SALE

Icom IC-24AT Dual band HT 2m/70cm. Good condition. Comes With A 5
watt battery and a 1.5 battery. Also comes with a useful One Hour Quick
Charger and the trickle charger that came with the radio. Here are some
of the specs; Full Duplex between 2m/70cm & vs. Four DTMF Memories.
40 Memory Channels. All PL Tones. Built in on/off timer & battery saver.
Receives Aircraft, Police, Weather, Cellular Phones, I even picked up the
Schools Bus Freq once.

Receive approx 110-127 MHz
approx 140-190 MHz
approx 400-499 MHz
approx 800-950 MHz

Transmit 140-150 MHz
440-450 MHz

WITH EVERYTHING: $300 OR Best Offer.

I live in Grand Rapids MI. Willing to ship to the 48.
For Offers OR Questions E-Mail j_dogg@grfn.org

>'73 de Alan WA6AQC

Well my 2700RH had a few mods done - like cross band repeat and
extended rx/tx to 430-450 (was 440-450)

Here's what I have :

Well - I'll have to get them from my other computer system, and for
some strange reason ALL mods databases no longer have the sheets on
the ft2700rh. Oh, well - e-mail me and I send them to you.

This is all I could find doing a search....

A mod for cross-band:
I modified mine to do cross band repeat.
Bring the busy (led) signal out to the mike jack on the "speach"
line, assuming it does not have the voice option.
Use a transistor switch to use the signal to key the PTT line.
Run a 500k resistor from the speaker audio out to mike audio in and
the volumne control at about half way will give good levels.
House the whole thing in a mike plug, no external cables.
Set up the radio for "full duplex", receiving on one band and
transmit on the other. Unplug your mike and plug in the cross band
plug.
This only works from one band to the other. Cross band from either
band is
possible with a little extra circuitry and explanation. Sent me your
FAX number
it you would like it.

Ken.

2189. Need Schematics for IC-225

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-11 00:00:00 UTC
From: ea4abb@linux.ea4abb.ampr.ORG
Message-ID: <Pine.LNX.3.91.960211132916.163B-100000@linux.ea4abb.ampr.org>
Source record: 205778

Hello everybody...

I have an IC-225 Icom transceiver, but some days ago I have a little big problem. When I transmit the transceiver make QRM 55 Khz up and 55 khz down.

I do not nedd to module the carrier, this QRM is done with only pushing the PTT.

I am looking for the schematic of this transceiver to try to solve it..

Perhaps someone can help me and had the same problem than me and solved it ??

Any comments are welcome.

Please e-mail me...
Tnx

Hi Bill:

I believe all that information is in the manual. If you don't have
the manual, write to me and I can read off the instructions or
mail you a copy of that page. I recall it is very simple, like removing
one jumper wire under the top cover.

FOR SALE FOR SALE FOR SALE FOR SALE FOR SALE FOR
SALE

Icom IC-24AT Dual band HT 2m/70cm. Good condition. Comes With A 5
watt battery and a 1.5 battery. Also comes with a useful One Hour Quick
Charger and the trickle charger that came with the radio. Here are some
of the specs; Full Duplex between 2m/70cm & vs. Four DTMF Memories. 40
Memory Channels. All PL Tones. Built in on/off timer & battery saver.
Receives Aircraft, Police, Weather, Cellular Phones, I even picked up the
Schools Bus Freq once.

Receive approx 110-127 MHz
approx 140-190 MHz
approx 400-499 MHz
approx 800-950 MHz

Transmit 140-150 MHz
440-450 MHz

WITH EVERYTHING: $300 OR Best Offer.

I live in Grand Rapids MI. Willing to ship to the 48.

Hy, from Ed KE6BNL. I purchased the IC-751A as my first hf rig as a new ham. I couldn't be happier. I have had a number of people want to trade it for more modern and newer rigs, I choose to hang on to it. The prices mentioned see to be a good choice $600-$800 I perchased mine at a garage sale with 80ft.tower coax and guy wires and a butternut verticle. I won't mention the price because it makes people sick. I was able to get on the air and use it with no help and have a ball. Let me know when you get it going and we can go at it dualling 751's GOOD LUCK Ed.
It is also nice it the radio has the built in power supply, I was lucky enough to have that feature. I take mine it my trailer camping on 12volts and use a screw drive antenae with good luck.

w8jitom@aol.com (W8JI Tom) wrote:

>Here's how I look at ten, twenty, and 160 meters examples.

Excellent analysis Tom! The gap widens even further when you consider used gear. A good, used 1,500W (input) amplifier can often be had for less than $500. It would be practically impossible to duplicate that 9-10 dB increase in signal strength on all the HF bands, at that cost, with an antenna farm. In addition, although a collection of used antennas and wire arrays might come close, a heavy-duty rotator old enough to be discounted into this price range would probably be less than reliable, and a tower might even be dangerous.

Getting back to the original question, a couple S-units in NOT insignificant, and anyone who thinks otherwise has probably never used an amplifier! Even just increasing power to the 500-600W output level makes HF operations MUCH more reliable. Sure, there are many times it's not required (and might even be considered wasteful), but the higher noise level and overcrowding on the lower HF bands can render barefoot operation a real chore. Maybe I'm getting lazy, but I just don't like fighting the QRM and QRN through a long CW ragchew anymore. That's not fun, it's hard work.

Incidentally, I consider QRP to be a totally different topic from all this. Running 1W (or 100mW) presents challenges that are unique to those power levels and can't be duplicated by either 1KW or the typical 100W-output transceiver. There's also an inherent interest in homebrew among QRP ops, and I have no small respect for someone who has the ability to earn WAS with a homebrew rig running 1W or less. I don't seem the have the patience for QRP anymore, but these guys are using and improving the skills that make someone a *real* operator.

73,
Jack WB3U

From: w8jitom@aol.com
Message-ID: <4fl1hl$54i@newsbf02.news.aol.com>
Source record: 205788

Hi Tom,

Here's my reasoning on this.

In article <4fg8ks$obd@kocrsv08.delcoelect.com>, Tom Pfaffenbach
<tvpfaffe@mail.delcoelect.com> writes:
>As far as "S" readings are concerned, about all that can be said, is that
>they will increase somewhat when the amplifier is turned on.

But since nearly all S meters are 3 to 5 dB dB per S unit, a 1500 watt amp will give ~~ a 4 S unit increase! In the fake and esoteric "S" units we are all used to, that's a lot. Even in "real" gain, 12 dB is a bunch!

>The single most important factor in radiating a good signal is having a
good
>antenna.

A good antenna is very important. But once the antenna is fairly efficent gain is hard to get on the lower bands! I always like to compare a dipole or other effective wire antenna to an antenna at the same height that will give me the same gain as the amplifier will. Here's how I look at ten, twenty, and 160 meters examples.

For ten meters, I can buy 12 dB for $2500 in a new PA and install a cheap wire antenna for ~~$50, or spend $2550 on an antenna alone. How much gain would I get in each case? A 60 ft guyed tower and a REAL twenty dB gain 10 meter yagi, tower, and rotator should cost about $2500. The antenna would help receive also, so that's good. I'd just get the antenna. But if I wanted another 3 dB (or more), I'd buy an amp! With my 12 dB gain yagi I'm at the limit of practicality. A 16 dB gain yagi system would cost a small fortune!

On twenty the 12 dB gain antenna would be *very* large and expensive to maintain. It would certainly cost more than $2550 when the tower and rotor (if I want to talk in more than one direction) is included.That's bad. On twenty, a better choice would be a 6 dB gain antenna and a small 6 dB gain PA ! I could do that for $2550.

Now look at 160, a ten dB gain antenna costs more than most of us make in a year, and takes up several acres of space. But the 12 dB amp still gives 12 dB! On 160, it's a not worth doing anything fancy with the antenna (other than a good basic installation and a cheap receiving antenna) until you've reached the 1500 watt limit!

The best choice on 160 is the biggest amp you can afford (and get away with running) and a simple but efficient wire TX antenna.

Top cover(if screwed down to tightly can cause problems!!
I believe that possibly the spring clip keeps the top cover
from shorting out any traces aon that back topt side board.
If the cover is tightened down to hard, it deflects, and bows
downward.
Some people have blown parts, while others luck out with no damage.
I believe Icom has a bug here mechanically, so be careful.
Lightly tighten the top cover screws down, also reform that clip
so that its becomes V-shaped(> 60 degrees, then place top cover on,
don't tighten top cover 4 screws to tightly, just lightly.

In article <9602061540.AA00827@shelob>, you say:

I noticed there was a severe loss of sensitivity on my new 706
and I read your note below. I placed tape under the spring clips and
hope this helps. I do not have the optional filters installed, so my
question is does this happen even when they are not installed. Also there
is a felt strip between the spring clip and the top cover on mine??????
I am new to ham radio and don't have a lot of electronics knowledge in
this matter. Will be installing the rig in my mobile hopefully tomorrow
in place of my Icom 2340.......e-mail me if you can...Thanks..Ray KE4UYN

2206. German ham mag reviews DSPs

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-11 00:00:00 UTC
From: fedpress@omnifest.uwm.edu
Message-ID: <4flcnv$d07@omnifest.uwm.edu>
Source record: 205795

What follows is a brief synopsis of an article reviewing the latest crop of digital signal processors that appeared recently in the German ham magazine "Funk". I would like to thank Hans AE9G for his assistance in translation.

-- Rick WB9GYT

The article has the following sub-headers:

What: just a filter?
Description of the CPUs
Notch filter
(A table)
Noise and interference reduction
Audio frequency filter
The instruction manuals
The construction (box/control panel)
Further features

The futher features section noted the spotting tone of the MFJ-784B; the self-test and tone generator (to adjust the center frequency) of the DSP-59+ from Timewave; JPS's NIR-12 "can even be used transmitter fashion, to processing one's own modulation. The manual suggests this for use in vehicles with high noise levels. JPS has software and an interface to process received signals with one's own computer for the knowledgeable person."

The final (summary) section of the article states "The instruments are drastically different in their style and type of features. So for that reason, a general comparison is impossible. Considering the properties where a general comparison could be made, the instruments seem rather similar and are not that different. In many regards, the subjective perception is very important.

"Whoever does not only prefer the digital modes, might like the MFJ-784B with the preprogrammed filters and comfort in use and for the possibility of storing its own filter configurations. Not only visually-impaired users will like the talk mode.

"As opposed to that, the DSP-59+ is the only one that has an optical readout of all concrete selectable frequencies. At the narrow bandwidth of 25 Hz, i8t is probably particularly attractive for the CW purist or EME people. Probably it would also be very useful for a technical person, the possibility of using the instrument as an audio frequency generator. The self-test promises continuing knowledge of the function of the instrument.

"Concerning the NIR-12, particularly many different interferences can be reduced or toally removed using the noise and interference functions: NIR and PEAK. For me, it's a big advantage, not only because of the additional

possibility of doing signal processing with one's own computer, the NIR-12 probably offers the greatest possibilities of separately coping with the desired and undesired signals.

"Finally, the buyer has to look at the features and has to decide for each instrumen which would correspond the best according to the user's personal needs (operating modes, etc.)."

Hi all,
I was looking at possibly getting an FX-146 for use with packet.
Since I don't require real frequency agility, just a few channels, this looks
to be a good kit. I do have the following questions:

- It says it's 9600 compatible; how well does it do?
- Easy to build/good instructions?

Anyone with any practical experience on this rig, please give me your
opinions.

Thanks and 73,
Russ KI7FL

Hi, I am writing for the Stoughton High School Amateur Radio Club. We recently recieved our club call sign and just found an advisor. The town we are located in is Stoughton, MA. We are in need of equipment to get the club going, like antennas, recievers, etc... The president is Jack Hamm III, callsign N1REU . I am not licensed yet but have half the requirments. There are only two licensed hamms in the school out of 1100 kids so we want to get the club going to get people interested. I am not in possesion of the club call sign but if you call Jack at 617-344-4636 and e-mail me we can fill you in on the details. Thanks in advance.

I have just bought an ICOM IC-2SAT minus instuction manual.
can anyone help me with the following points:-

1) does this radio have a tone burst for reapeter use ,if so how
is it operated?

2) my radio seems to have rx 100-200 Mhz and tx 140-150Mhz
but the disply will read 0-1300 Mhz. does this mean it can
be made to receive from 0-1300 Mhz if so how?

3)does anyone know of any other mods or add-on modules for the
2-sat ?

i would be greatful of any help or details on this radio..

THANX

ROB!!!!!

Source record: 205716
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

Greetings!

I wish to sell a spare Drake TR-4C transceiver and AC-4 power supply. The rig was advertised as "nice, low output" when I bought it, but I can't honestly say it is...see a separate message for the gory details of the sham transaction, and beware David Posmoga K3MGC!

Anyhow, in the interest of full disclosure, I'll try to describe it accurately. The rig works quite well on receive, with all receive functions. The transmitter is not working properly, and I believe the cause to be the finals or associated components. The cabinet looks OK, but has been repainted, and there is a small bend in the lower left front. The knobs all match, but only the tuning knob is original Drake. :-) The front panel looks nice, and the rig has a full set of tubes. The chassis needs cleaning.

On the other hand, the AC-4 is real nice, and works well.

So, I would rate this as a cheap fixer-upper, or very complete parts set. I don't think it is too far from being "airworthy". :-)

I would prefer to swap for other Drake gear, tube-type receivers, or early solid-state receivers. I'd even pay shipping in trade for a nice R-4B. I will also sell the rig and PS outright.

Now get those replies rolling!

Friend,

A fully functional standalone Broadcasting Radio Station Database for IBM and compatibles with more than 4,000 Radio Station records already. This program covers stations on Longwave, Mediumwave, and Shortwave. Each record contains the Station name, Frequencies, Schedule, Languages, Country, and Continent. The program sorts in same order.

What's needed to get it? Your EMail address and your Postal Mailing address for registration and future information via Post of other Radio Related Database programs. This information will be kept confidential.

If you can read a document written in MS Word(extension is DOC), request the operating instructions for the Radio Station Database Program called Voyageur. You'll get an idea from reading this document of the Voyageur Database and what it does.

Incidently, the program offered with this notice is valid until June 6, 1996.

Hope to hear from you..

Chuck

>OK8VSQ/OM/G4VSQ
>Caversham, UK

Here's what I have on various after-market battery makers:

Battery-Tech, Inc.
800-442-4275, 28-25 215th Place, Bayside, NY 11360 USA, 718-631-4275 voice,
718-631-5117 fax.

W & W Associates, 800 South Broadway, Hicksville, NY 11801-5017 USA,
800-221-0732 USA/Canada, 516-942-0011 voice, 516-942-1944 fax.

E.H. Yost & Company, 608-831-3443 Voice, 608-831-1082 fax, 2211 D Parview Rd.,
Middleton, WI 53562 USA. (a.k.a. Mr. Nicad)

Alexander Battery Co. West, 800-421-1108 outside Cal., 800-327-0814 in Cal.,
Fax 619-480-1351, POB 28880, San Diego, CA 92198 USA

Alexander Batteries, 1511 S. Garfield Place, Mason City, IA 50401 USA,
515-423-8955 voice, 515-423-1644 fax.

Periphex, Inc., 115-1B Hurley Rd., Oxford, CT 06478 USA, 800-634-8132,
203-264-3985 voice, 203-262-6943 fax.

And somewheres around here I thought had a J-Bro catalog, but I can't find
it. Note that the W&W and Battery-Tech catalogs look the same, and have the
same dates on them. I don't know if it's the same company or what.

Source record: 205719

George: On your mods for the 570, I put the cross band repeater option in mine several months ago. It is easy to do. A little circuit board goes inside and you get a new cover for the radio that has the Radio/Repeater switch on it. I think that some of the later 570's had this installed from the factory. Call ALINCO in California and get the info from them. I ordered the kit from AES, but they did not know anything about it. I had to get the correct info from ALINCO directly. I cannot find my information or I would pass it to you.

I think that Rob has it right. Internet email host names are case
insensitive. (But user names may not be.) Compuserve's mail system will
definitely not bounce this and your host system should get the correct
address from the dns with this name, if it isn't broken. Judging from the
six copies of the posting you sent, I wouldn't bet on that.

BTW, the format of `Best address' which you suggest is perfect for sending
email from one CompuServe user to another Comuserve address but via
Compuserve's Internet gateway, which is a fairly unusual thing to do.

From: blood@austin.ibm.com
Message-ID: <4fnqpk$22tk@ausnews.austin.ibm.com>
Source record: 205731

I tried the following configuration with poor results.
On a pickup rear window, a larsen 2m on one side and a 440 MHZ on the
other. Feeding with a Kenwood dual band mobile. The Kenwood did not like
this and shut down the xmitter on high power. By placing a small
flurescent (sp) bulb near the coax, it was apparent that there is a LOT of
rf radiated in the coax (inside the cab), the bulb will light. I tried grounding
the coax near the window but this did not help. I now run with a 1/4 wave MFJ
mag mount. The kenamod is much happier when using a mobile duplexer.
On the up side though, the glass mount will work better than
you expect, if your rig can match it. I still have the 2M glass mount
on, and use is as an ant for a secondary rig. A nice feature
of the antenna is that the element can be moved around easily to adjust for
low clearance without needing the allen tool.

2239. Help me ID this equipment.....

Hello all:
I've bought a rack mounted data terminal, has Honeywell dumb terminal, keyboard, lightning arrester, modem, data distributor, and rf in and out connection box. Hooked it up to a scanner to receive various frequencies that I knew contained data. The screen fills up with computer gibberish type characters. I don't expect anyone to be able to ID this unit from this vague description but perhaps someone will recognize some of the individual components listed below:

Modem: UDS Brand, V.23 A/S Data Modem

'Avanti' brand 600G Local Area Data Distributor

Honeywell terminal and keyboard: MX-10173/MYQ-4, and has several 25 pin ports on the rear, as well as several dipswitches and other controls.

'T-Bar' brand TX/RX switch, part # 5742-m397-3

I believe this to be a former military portable terminal. Mounted in a really nice 27" black anodized rack with handles. I have no idea what type or speed of data it was intended to recieve and or send. Any help appreciated.

Cordially:
Rick Crider

I agree about the Larsen. I have modeled most mobile dual band glass mount antennas and can say that on 2m most are OK, while all but the Larsen are pretty poor on 70cm. The main problem is a high angle of radiation on 70cm due to poor phasing of upper and lower sections. It turns out that the short overall length and requirement to get dual band operation force them into this condition.

As far a not liking glass mount antennas...There is nothing wrong with them in principle. They are uaually end fed half waves (zeps) or stacked halfwaves. The trouble is that many manufacturers have done away with the coax braid connection to the car body. This is important! An end fed zep still needs a counterpoise to work against. I have had good luck with adding a section of copper tape from shield to car body on some brands. Note: the Larsen uses two capacitors to go through the glass and puts the matching network on the outside of the glass. I don't know what their schematic looks like, but suspect that this is superior due to the ability to get counterpoise currents on the coax without a connection to the car body. I have compared the Larsen dual band thru the glass with the Larsen dual band mag mount by driving in weak signal areas with the two antennas connected to a coax switch. (Yes this is not a rigorous test), and can say that if there is a difference it is small.

Hi, I've got version 1.5. It is a great unit for the new packeteer or the
seasoned vet. It is a fairly simple program, small and easy to manipulate.
All u need is a comm port (I think) on your computer. U can run the program
off a floppy disk if you like. I have mine configured like a small BBS.
No mail forwarding in it. Local users can get the area wx and forecast,
and digi thru me.
Seems easy to write files into it. Fairly simple to edit them for use.

Biggest draw back is that when the Baycom is running, nothing else can be
done. The computer is tied up with it. The manual says that u can shell
```

out of it and leave the program active, but I've never gotten that to work properly. It may run a while then lock up. But when running by itself it is a very nice little program. Manual, copy of software, and the RS 232 plug from Tiger, BayPac, several others sell it total cost about $90 give or take. Great for portable packet or field day.

The DTMF scheme is actually 16 keys, not the 12 commonly seen on a
telephone. Digits 0-9, *, # and letters A-D all yield their own DTMF
tone pairs. In the case of amateur radio, one place the letter'd
tones are used is in repeater control. By including these 4 letters,
the potential number of control codes is greatly increased.

INTRODUCING HAM RADIO ONLINE INTERACTIVE!
Now you can post free classified ads, DX openings, VHF band openings
and much more. And with over 10,000 readers stopping by last month,
your thoughts will actually get read at this ham radio web site! We are not
just pointers to cyberspace - we've got actual content - feature articles,
newsletters, product reviews, real-time propagation conditions and more.

The February 1996 edition of Ham Radio Online International Magazine
is available at http://www.accessone.com/~vbook/hronline.htm

Some of the NEW February stories include a review of SkyTel's "2-way paging" system,
radio surveillance frequencies, and the effects of two-way radio operation in blasting
zones.

Ham Radio Online has been selected as a featured web site by America Online
and a Top 100 web site for the month of January by Planet Earth, Inc.
New articles are available now and we add articles throughout the month.

Ham Radio Online has up-to-date news about Amateur Radio from around the world,
feature stories, real-time propagation and auroral condition reports, real-time
earthquake and severe weather conditions for emergency communications planning,
online humor section and the Ham Radio Online Library with fully indexed (find
any section with just a mouse click) Part 97 rules and regulations.

Plus we cover broadcasting, shortwave, scanning generally anything having to
do with radio telecommunications.

And we plan to offer some totally cool new services during the coming months. As
always its free and free of ads.

Thanks to you, we had over 10,000 readers stop by during January!

Please enjoy!

These tubes have more differences than just the external anode. Check the Eimac sheets. If you're considering an update - check 3CX800A7's if you'd be willing to modify to the degree
required between a 8875 to an 8874. BTW, IMHO, both good designs - just that new designs offer improvements and about same money.

I built an FX-440 (UHF), but it is very similar to the FX-146. The
instructions were OK, the alignment is best done with a signal generator
and oscilloscope, especially if you plan to receive 9600 baud.

As for transmitting 9600 baud, this radio uses a single loop
synthesizer with FM done by modulating the VCO tune line. This
has no DC response and poor low end response, which means you
will get poor 9600 baud performance from the transmitter.

The SM-220 alone is simply a station monitor, without any panadapter functions. An additional circuit board is required to use it as a panadapter. There two such boards: the BS-5 and the BS-8. The BS-5 is for use with the Kenwood 500 series HF xcvrs, like the TS-520. The BS-8 is for later transceivers with 8.83 MHz IF.

>>on ten meters.
>
> 5 mW.

The manual for mine (which is a little older based upon the schematics)
says that the small preset pot on the main circuit board half-way along
the side remote from the PA compartment allows adjustment of drive
level from 5 mW to 750 mW. Additionally, if you have less drive than
that, there are two pins near the pot that can be shorted together
to increase the transmit sensitivity to 0.1 mW to 15 mW.

My manual says the pot comes preset to a 500 mW drive level.

Adjustment is to apply a 28 MHz carrier and adjust the pot until the
transverter just draws maximum DC current. Nothing like maximum smoke
procedures. ;-)

>
> ------------------------------

Dave,

You are in luck, as I have just done a mod to mine to fix this insenitivity. The IC 3220 range use two separate RF front ends on UHF - one for inside the designated Amateur Band and one for outside - actually it looks as if it was originally designed for a third front end for 800-900MHz but that is not fitted. The problem I had was that the 'A-Band Unit' (aux UHF front end) was tuned for the Japanese commercial freq range around 300-400MHz - this Aux front end has lower gain, but is about 100MHz wide rather than 12MHz and also doesn't have a real flat response.

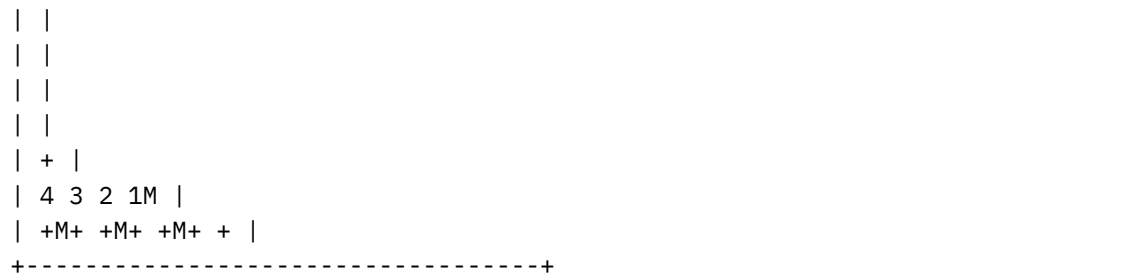
For this mod you will need:

1. 3 x 10nH surface mount inductors
2. Some method of mounting and removing SM inductors
PS not a 60W iron!!

1. Open the bottom of the radio, and check for the presence of a small board vertically mounted to the main board in the centre parallel to the sheilded box - no its outside of the sheilded box. If this board is not there, then you don't have the 'A-Band Unit' but only the 12Mhz wide Amateur filter.

2. Holding the radio with the heatsink up so that you are looking at the top of the ABU identify the four SM inductors - white plastic SM formers with enammelled windings. Don't worry if the new ones you have look different - they may well look much like a chip capacitor with a spiral visible on the top surface.

| | | | | | | | | | - pins to mount
to UHF board
+--+--+--+--+--+--+~~+--+--+--+--+--+ sorry don't
remember how many!



3. Carefully remove inductors 1, 2, and 3. SM tweezers would be best but I managed with two temp controlled (very fine irons). Carefully heat the pads (minimum heat) and as you see the solder melt use the irons to lift the inductor. Be very careful of the parallel mounted components nearby.

4. Clean up the pads (solder suck or braid) again be careful of adjacent components.

5. Tin one only pad (on the board) for each new inductor - put the component on the board in such a way that you can ease it into place with tweezers while you heat the pad that you pre-tinned.

6. Solder other end.

Note Inductor 4 acts as an RF choke on the power supply to the ouput transistor so need not be changed.

This moved the upper freq response on my rig to about 512MHz from about 410MHz (not that the radio tunes that high!) but the next larger inductor I could get was 15nH and that was too big to do anything to the response (you could try a 12nH if you can get some - best filter response is just below the cut off about 490Mhz-510Mhz in my case - radio tunes to 479). I now have about 0.2uv/12db sinad at 477MHz, about 0.3uv at 410MHz. Amateur Band 430-440MHz here in Oz the rig is 0.12uv, and 0.16uv on 146MHz.

73's

PS this rig does do cross band repeat - set up each band (even repeater offsets) - then hold in the two blue buttons for a couple of seconds (SET & BAND) - flashing L on right side. To get out repeat - note power off does not get out.

PPS DO-NOT alter the tuning of the Amateur Band UHF filter - when tuned well its only about 12MHz wide - centred on the 10MHz wide band that the radio is programmed for. When the radio is not tuned in this range 430-440 (Oz) 440-450 (US) etc then this filter is not enev used!

Jack.
I am an avid QRPer, and I take the above paragraph as quite a big compliment! Thanks! I firmly believe that literally anyone can do WAS, WAC, DXCC, etc, using 100 W or more. It really does take some skill and determination to earn awards using QRP, especially using homebrew equipment. So, thanks from the QRP community for your compliments!

BTW, I have 49 states confirmed on QRP-CW, running 4W or less to my Butternut HF-6V vertical (my only HF antenna), and over half of the contacts are two-way QRP. Perhaps half of the contacts were also made using home-built equipment on my end, the rest using Kenwood rigs turned down to QRP level. I only lack Alaska (any KL7's wanna set up a sked on 20m or 40m CW and listen for my weak signal?).

2283. Is there an all purpose TNC/Decoder?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-13 00:00:00 UTC
From: rickcrider@aol.com
Message-ID: <4fr86i$ciq@newsbf02.news.aol.com>
Source record: 205681

Been a ham for several years......though yet to venture into packet. I'm terribly confused as to what TNC to buy. I won't say that money is no object, but, rather than buy several pieces of gear, I'd rather spend on the 'right stuff'. I would like a unit that would handle regular ham type packet, as well as decode other data transmissions, such as pagers, both digital and alphanumeric, DTMF tones, and other various data transmissions that may be occupying the airwaves here about the premises. Is there such an animal? If not, what various pieces of seperate equipment would one need. All help appreciated.

Here is a copy of somthing I kept for my IC-Z1A, which is the same
radio as the W31. The only thing that is different is that on my
Z1A is that the face comes off as a speaker mic.

>* vannossc@ipssmail.sch.ge.com ** are my own. *
>**

Ok, after messing around with the radio on my own and then getting the
"official" mod, here's a summary of the various diode mods for the Z1A:

Icom Z1A mods

[B]+[#]+[POWER] = Extended Receive.
VFO *DISPLAYS* 50-299.900 and 300-999.900.
AM Aircraft band enabled.
SET mode now has a new "PLACE" function for setting
the direct entry starting digit.

There is room for four diodes in the Z1A located on the CPU board to the left
of the ribbon cable connector. On a US version, only the bottom two are
installed. D15 is just below and to the right of the four diodes. These
diodes are bigger than the rest of the surface mounted components and are easy
to spot.
The official ICOM mod (which I unofficially saw...) is to remove D15 for
extended TX and to use the above keyboard mod for extended receive. According
to the sheet, the 800-900 band is NOT available in US versions.

```
+-+ +-+
| | | | <---- Installing diodes in either of these seems to do
+-+ +-+ nothing.
```

```
+-+ +-+
| | | | <---- IN: US Version 144-148 TX 440-450 TX
+-+ +-+ OUT: Extended 136-174 TX 380-470 TX (Lose auto-repeater
^ and tone encode)
|
+------------ IN: US 144-148 TX 440-450 TX
OUT: European 144-148 TX 430-440 TX
```

```
+-+
"D15"--> | | <---- IN: US Version Stock
+-+ OUT: Extended TX 136-174 380-470 (keeps auto-repeater
and tone encode)
```

A word of warning about messing with the four diode pads: If you detach
either one of the installed diodes, the CPU will reset and you'll lose ALL of
your memories. (found that out the hard way...) D15 doesn't seem to affect
the memories at all.

Since the 800MHz band is not available in US versions, my guess is that
there's a keyboard mod to unlock it instead of a diode. The diodes only seem
to control the country versions. If anyone has any more keyboard mods, please
post them.

Subject: Advice on Icom 751

Being a fairly new ham I am not as familiar with all of the HF rigs out there as I hope to become. There is a member of our club who has upgraded his station and will soon be selling an Icom 751. I would like any information or opinion on this particular radio. I am particularly interested to know if it is a good radio for CW work, if it has any known inherent inadequacies, is it too much or too little radio for one with little experience but high hopes and of course, what is an equitable price for a used 751 in good to very good shape.

Any, and all help is greatly appreciated.

From: "Gary P. Fiber" <gfiber@halcyon.com>
Subject: ICOM IC-2SAT HELP!?

>1) does this radio have a tone burst for reapeter use ,if so how
>is it operated?

On the 2SAT, 1750 Hz burst could be added if the serial number was below
about 9500, also the minimum offset tuning step size needed to be 25 kHz.
Here you would need to convert the radio to a european version and install
2 SMD resisotrs. After S/N 9500 or so the offset tuning was made
adjustable and the 12.5kHz tuning step was removed, also so was the ability
to have a 1750 hz tone burst. The reason was to free enough memory in the

CPU to have the adjustable offset tuning steps rather than the original
fixed 25 khz tuning in the earlier model 2SAT radios.

>2) my radio seems to have rx 100-200 Mhz and tx 140-150Mhz
>but the disply will read 0-1300 Mhz. does this mean it can
>be made to receive from 0-1300 Mhz if so how?

The radio will actually receive from 110 to 136 aircraft A.M. and 136 to
174 Mhz F.M. Signals above or below this range are usually overloads or
images. The tuning ability never stopped in the CPU program, how ever the
VCO never had the kind of range the frequency readout would report.

> are particularly bad. Is this a valid observation? How do
> other makes compare? Thanks.

Standard (Marantz) has always claimed excellent IMD rejection for their rigs.
As an
owner of several Standards, icluding two C5718DA 2m/70cm, I can attest to the
truth of
this claim. I live on a high hill, the very top of which is the highest
point in the
Milwaukee area. Within three miles are literally about 60 repeaters, for
everything
from 6m ham to 800 MHz public service, and everything in between. Also two
cell sites,
quite a few pager towers, several commercial broadcast towers, and a military
communications facility, complete with a camouflaged communications tower (it
gets "top
billing" as the very highest structure in the Milwaukee area, BTW.) In other
words, a
really, really IMD-prone area. I have yet to experience *any* IMD with any
of my

Standards - not even once - except on the 900 MHz band, which does get IMD from the
really-close cell site (under a mile.) Luckily, the 900 MHz miltary radar facility
that used to adorn my hill (across the street from the place with the camouflaged
tower) is now a city park, along with the Nike missile launching facility at the
hill's bottom. I can only shudder to think of the interference *that* would cause.

From: rickcrider@aol.com (RICKCRIDER)
Subject: Is there an all purpose TNC/Decoder?

Been a ham for several years......though yet to venture into packet. I'm terribly confused as to what TNC to buy. I won't say that money is no object, but, rather than buy several pieces of gear, I'd rather spend on the 'right stuff'. I would like a unit that would handle regular ham type packet, as well as decode other data transmissions, such as pagers, both digital and alphanumeric, DTMF tones, and other various data transmissions that may be occupying the airwaves here about the premises. Is there such an animal? If not, what various pieces of seperate equipment would one need. All help appreciated.

Subject: Kenwood Monitor: SM-220

Hugh Catlett wrote:

> SM-220 was made to be used with at least the Kenwood 830.

The SM-220 alone is simply a station monitor, without any panadapter functions. An additional circuit board is required to use it as a panadapter. There two such boards: the BS-5 and the BS-8. The BS-5 is for use with the Kenwood 500 series HF xcvrs, like the TS-520. The BS-8 is for later transceivers with 8.83 MHz IF.

From: Danie Brynard <danie.brynard@pixie.co.za>
Subject: Power adjustment on the TS-440S

I also had a TS440S. I agree you cannot vary the SSB output power on a TS440S except by controling the ALC voltage at the back of the radio. I built myself a little box for controling the ALC when I still had the 440, used it for QRP on HF.

The mic gain is a very unreliable and non-linear way of controlling the 'rf' power. It is not meant for that. Try using the mic gain when driving a 10mW transverter !

I went thru this whole story years ago - don't waste time with the mic gain control.

I now have a ts690s: kenwood decided to implement a rf output control on it, it works wonderful. Why have they decided to do it ? Make up your own mind.

>>on ten meters.
>
> 5 mW.

The manual for mine (which is a little older based upon the schematics)
says that the small preset pot on the main circuit board half-way along
the side remote from the PA compartment allows adjustment of drive
level from 5 mW to 750 mW. Additionally, if you have less drive than
that, there are two pins near the pot that can be shorted together
to increase the transmit sensitivity to 0.1 mW to 15 mW.

My manual says the pot comes preset to a 500 mW drive level.

Adjustment is to apply a 28 MHz carrier and adjust the pot until the
transverter just draws maximum DC current. Nothing like maximum smoke
procedures. ;-)

I can only tell you that I own an FT-5100 for 2 years now and
it has been an outstanding radio. I had the expanded receive
mod done and that has worked out well too. We have quite a few
hams here in Northern Virginia that use that radio and I have
yet to hear a problem with it.

Good luck with whatever you do.

>For example, the claim that each and every radio
>is uniquely identifiable, even radios of the same model and production
>run. Granted, variation in component values will result in slightly
>different PLL characteristics, but I have yet to see any evidence that
>suggests that the resulting fingerprint varies enough to be considered
>"unique".

Ok, here is more variables in the system, voltage, SWR, reactance, impedance?

One of my rigs is an HTX-202 (like 10,000) others out there. What do you
think would happen to the fingerprint if I ran on batterys, weak batterys,
12v from the car, on 13.8 with a smidge of ac ripple? Hi power,
low power, an antenna with high swr? Duck? An antenna with a capacitor in
series, started to tx while holding the antenna with my hand then releasing
it? When the radio is cold?

I would think that the fingerprints would be quite unstable unless you always
used the same exact antenna, voltage, temp, location...

I think that only permitting signals that had a matching fingerprint as
opposed to letting all signals except x,y,z would work better.

>So unless the hash breaks through TSQ on one of YOUR favorite freqs, it may
>not bother you, but it sure does me!

I thought my FT40 stoped doing this when I exit the squelch setting. I
thought it was just for my convience in setting the squelch that is
was giving me some static. Now I played with it and noticed that mine
does this no matter what, even without the hash, if I turn the
squelch down I get the noise in bursts as you describe.

Any word on fixes?

I have a mint PTS160 frequency Synthesizer by Programmed Test Sources.
It generates carriers from 100 KHz to 160 MHz in 1 Hz steps. The unit uses
Direct Analog Synthesis and can switch frequencies in extremely short times.
Power is adjustable from the front panel up to around 15dBm. Unit is calibrated
and within 1Hz of WWV. This unit sells new from PTS for over $7000. Asking
$1200. OBO. Unit has TCXO, GPIB, Rack mount and other options.

>Is anyone using the Alinco DX - 70T and if so, what is your opinion of
>the radio. Thanks, KC5OQE
>

Generally I like it. I sort of wished I'd waited for the 706 now, but it does most of what I needed it to do. It does have some bugs and quirks and two outright problems, but all new radios do.

The two big problems are that 1) the noise blanker doesn't work and 2) there's no 500 Hz cw filter as advertised.

The factory claims to have a fix for the noise blanker problem, and I'll be sending mine back in under warrenty to get that fixed. Something about some gain missing in the driver for the gate circuit. They weren't too detailed on the phone.

On the missing filter, I was told I'd have to talk to Taka. I don't know what that means - but it doesn't sound promising. I haven't sat down yet and written him, I've been waiting for a bit to see if they come up with improved firmware for some of the little things, but I'm about ready to send it off. The specs claim SSB wide and narrow as something like 2.4Khz wide and 1.0 Khz narrow and for CW as 1Khz and 500 Hz - which would make a pretty reasonable filter set. I suspect the 1.0Khz for the SSB is a typo, maybe they meant 1.8 Khz, but it definately does narrow things down. But on CW, the narrow position only sounds like they added an audio low pass filter behind whatever the narrow SSB filter is - the high frequency hiss drops, but if you tune across a signal it is *much* wider than a 500 hz filter - as I recall the signals were plainly audible across about 1.7 Khz of tuning range. By no means the '500 Hz cw filter' one would expect from the spec sheet. And there's no provision to add extra filters. Having traded a radio with a good CW filter towards the DX-70T, I'm a bit cranky that they don't meet their published spec on the cw filter.

The quirks were more like oversights in the firmware. If you are trying to operate cross band using the split mode, the receive mode is forced over that selected in the transmit VFO. For instance I was trying to listen to 6m FM talking with a Tech friend while he listened to me testing on 28 mhz SSB. The appropriate frequencies were in the two VFO's, A and B, but when I pressed the PTT I was surprised to find I was transmitting FM on 28, instead of the selected USB mode. Not a terribly common situation, but the radio should do it - other wise what's the point of setting the mode with the VFO?

And if you operate much 6m, and need tones the tones are selected manually by a set of dipswitches on the bottom of the radio - not terribly handy, especially in the mobile environment. I'm planning to see if that's a socketed ☐☐☐ dip switch and if it is replace it with a cable up to an external thumbwheel switch to I can at least select the tones without having to pull over and demount the radio. It should have been done in software with the VFO and Memories.

On the plus side, it gets great audio reports consistently. It's a nice size for the mobile. It's practically indistinguishable from a TS-50 when sat side by side - I suspect they co-opted the maker of the TS50's case to build the same thing for them with an extra coax connector. It does a nice job with AM receive for SWLing on the highway. The memories are handy for that and for getting around in the band while mobiling. The controls are pretty logical - I don't need to keep the manual with me to do most things. With the noise blanker fixed and the proper CW filter I'd count myself pretty satisfied, although perhaps a bit envious of the 706 for the higher power on 6 meters and the 2 meter coverage (and the cute stuff like the microphone up/down button keyer)

If you can get it at a reasonable price and don't need the high power on 6 or the two meter coverage and don't do more then very casual cw operating - it's a pretty good rig. I suspect it's been largely eclipsed by the Icom 706 and may either be dropped from the line or updated - but for mobile phone work it's a good less expensive alternative to the 706 and has some nice things going for it.

YMMV

Way back when, I put Jackson drives on a couple of HW-100/101's. Used at the time, the Swan 350 aluminum outer knob and black plastic inner knob, so it looked just like a Swan knob assembly. There is no better upgrade for that crappy original arrangement. I don't know if Swan knob assemblies can be had anymore--I would doubt it. I HAVE heard that Silitronix 11-meter VFO's use the same units.

Call Icom in Bellevue, WA at (206) 454-7619.
They should be able to look it up and get one on order if it's still
available. I have had excellent service from them.

2306. Re: FT 840 power adjustment question

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-14 00:00:00 UTC
From: kn6cr@aol.com
Message-ID: <4ftso9$bg4@newsbf02.news.aol.com>
Source record: 205623

Dear KN4FR and interested,

The 840 puts out between 5 and 6 watts on 20 meters with the "rf power" knob turned all the way counterclockwise. I've used it with the Ten Tec 6 meter transverter with no problem--it's a nice combination.

Here's another trick, from AA4ZX on the qrp-l mailing list:

Open the top case of the rig, and on the right side, very near the front panel, right behind 5 pots, is a little slide switch market 50-100. It's in the 100 watt position for US radios, but if you slide it over to 50 watts, you'll only put out about a watt or two at the minimum power setting. You can use the BOTTOM part of the power out scale on your po meter, the one that maxes out at 50, to get a more expanded scale for the first 5 watts.
Good luck!
Matt AA2ZD

>* vannossc@ipssmail.sch.ge.com ** are my own. *

>***

Ok, after messing around with the radio on my own and then getting the
"official" mod, here's a summary of the various diode mods for the Z1A:

Icom Z1A mods

[B]+[#]+[POWER] = Extended Receive.
VFO *DISPLAYS* 50-299.900 and 300-999.900.
AM Aircraft band enabled.
SET mode now has a new "PLACE" function for setting
the direct entry starting digit.

There is room for four diodes in the Z1A located on the CPU board to the left
of the ribbon cable connector. On a US version, only the bottom two are
installed. D15 is just below and to the right of the four diodes. These
diodes are bigger than the rest of the surface mounted components and are easy
to spot.
The official ICOM mod (which I unofficially saw...) is to remove D15 for
extended TX and to use the above keyboard mod for extended receive. According
to the sheet, the 800-900 band is NOT available in US versions.

+-+ +-+
| | | | <---- Installing diodes in either of these seems to do
+-+ +-+ nothing.

+-+ +-+
| | | | <---- IN: US Version 144-148 TX 440-450 TX
+-+ +-+ OUT: Extended 136-174 TX 380-470 TX (Lose auto-repeater
^ and tone encode)
|
+------------ IN: US 144-148 TX 440-450 TX
OUT: European 144-148 TX 430-440 TX

+-+
"D15"--> | | <---- IN: US Version Stock
+-+ OUT: Extended TX 136-174 380-470 (keeps auto-repeater
and tone encode)

A word of warning about messing with the four diode pads: If you detach
either one of the installed diodes, the CPU will reset and you'll lose ALL of
your memories. (found that out the hard way...) D15 doesn't seem to affect
the memories at all.

Since the 800MHz band is not available in US versions, my guess is that
there's a keyboard mod to unlock it instead of a diode. The diodes only seem
to control the country versions. If anyone has any more keyboard mods, please
post them.

SUBJECT: ** FS : WINDOWS'95 CD UPGRADE $50 **

I have still available a few Windows '95 CD-ROM Upgrade kits.

These are new, sealed, Microsoft Windows '95 CD-ROM Upgrade
Kits received with a computer order that I don not intend to use
with the computers they were received for.

These kits include the manual, CD-ROM disk, software registration
card, and Microsoft holographic Certificate of Authenticity.

The price is $ 50.00 each shipped by 2nd Day Priority Mail.

Send a check to :

Robert Reed WB2DIN
538 Brewers Bridge Road
Jackson, New Jersey 08527

TEL : (908) 363-2724

I will be selling the remaining Kits at the LIMARC Hamfest in
Frreport, NY on 2/25 and the Absecon, NJ Hamfest on 3/2 but
cannot be certain there will be any left afterwards.

From: wwhite@southwind.net (Wayne White)
Subject: Advice on Icom 751

Being a fairly new ham I am not as familiar with all of the HF rigs out there as I hope to become. There is a member of our club who has upgraded his station and will soon be selling an Icom 751. I would like any information or opinion on this particular radio. I am particularly interested to know if it is a good radio for CW work, if it has any known inherent inadequacies, is it too much or too little radio for one with little experience but high hopes and of course, what is an equitable price for a used 751 in good to very good shape.

Any, and all help is greatly appreciated.

2M FM REPEATER EQUIPMENT FOR SALE:

The Denton County Amateur Radio Association (W5NGU)
is offering the following 2m FM repeater equipment
for sale:

Repeaters: (two available)
RCA Series 500, model C2CK7CJATDB03Y
Base/repeater with DC remote control
150 MHz, 60/100/115 Watt
1B-8028476
equipped with SYM 860 Auto Duplex Terminal

Duplexer: (one available)
Decibel Products DB-4060-WC-A
(can be converted to "B" model for 144 MHz)

Prices are negotiable. Equipment is located in
Denton, Texas, about 35 miles north of Dallas on
Interstate 35. Equipment was donated by FEMA.

From: "Gary P. Fiber" <gfiber@halcyon.com>
Subject: ICOM IC-2SAT HELP!?

>1) does this radio have a tone burst for reapeter use ,if so how
>is it operated?

On the 2SAT, 1750 Hz burst could be added if the serial number was below
about 9500, also the minimum offset tuning step size needed to be 25 kHz.
Here you would need to convert the radio to a european version and install
2 SMD resisotrs. After S/N 9500 or so the offset tuning was made
adjustable and the 12.5kHz tuning step was removed, also so was the ability
to have a 1750 hz tone burst. The reason was to free enough memory in the

CPU to have the adjustable offset tuning steps rather than the original
fixed 25 khz tuning in the earlier model 2SAT radios.

>2) my radio seems to have rx 100-200 Mhz and tx 140-150Mhz
>but the disply will read 0-1300 Mhz. does this mean it can
>be made to receive from 0-1300 Mhz if so how?

The radio will actually receive from 110 to 136 aircraft A.M. and 136 to
174 Mhz F.M. Signals above or below this range are usually overloads or
images. The tuning ability never stopped in the CPU program, how ever the
VCO never had the kind of range the frequency readout would report.

> Can anyone recommend a good IMD resistant rig for 2M (and
> possibly dual bander with 70cm) I noticed that Kenwood rigs
> are particularly bad. Is this a valid observation? How do
> other makes compare? Thanks.

Standard (Marantz) has always claimed excellent IMD rejection for their rigs.
As an
owner of several Standards, icluding two C5718DA 2m/70cm, I can attest to the
truth of
this claim. I live on a high hill, the very top of which is the highest
point in the
Milwaukee area. Within three miles are literally about 60 repeaters, for
everything
from 6m ham to 800 MHz public service, and everything in between. Also two
cell sites,
quite a few pager towers, several commercial broadcast towers, and a military
communications facility, complete with a camouflaged communications tower (it
gets "top
billing" as the very highest structure in the Milwaukee area, BTW.) In other
words, a
really, really IMD-prone area. I have yet to experience *any* IMD with any
of my

Standards - not even once - except on the 900 MHz band, which does get IMD from the
really-close cell site (under a mile.) Luckily, the 900 MHz miltary radar facility
that used to adorn my hill (across the street from the place with the camouflaged
tower) is now a city park, along with the Nike missile launching facility at the
hill's bottom. I can only shudder to think of the interference *that* would cause.

Subject: Is there an all purpose TNC/Decoder?

Been a ham for several years......though yet to venture into packet. I'm terribly confused as to what TNC to buy. I won't say that money is no object, but, rather than buy several pieces of gear, I'd rather spend on the 'right stuff'. I would like a unit that would handle regular ham type packet, as well as decode other data transmissions, such as pagers, both digital and alphanumeric, DTMF tones, and other various data transmissions that may be occupying the airwaves here about the premises. Is there such an animal? If not, what various pieces of seperate equipment would one need. All help appreciated.

Subject: Kenwood Monitor: SM-220

Hugh Catlett wrote:

> SM-220 was made to be used with at least the Kenwood 830.

The SM-220 alone is simply a station monitor, without any panadapter functions. An additional circuit board is required to use it as a panadapter. There two such boards: the BS-5 and the BS-8. The BS-5 is for use with the Kenwood 500 series HF xcvrs, like the TS-520. The BS-8 is for later transceivers with 8.83 MHz IF.

From: Danie Brynard <danie.brynard@pixie.co.za>
Subject: Power adjustment on the TS-440S

I also had a TS440S. I agree you cannot vary the SSB output power on a TS440S except by controling the ALC voltage at the back of the radio. I built myself a little box for controling the ALC when I still had the 440, used it for QRP on HF.

The mic gain is a very unreliable and non-linear way of controlling the 'rf' power. It is not meant for that. Try using the mic gain when driving a 10mW transverter !

I went thru this whole story years ago - don't waste time with the mic gain control.

I now have a ts690s: kenwood decided to implement a rf output control on it, it works wonderful. Why have they decided to do it ? Make up your own mind.

>>on ten meters.
>
> 5 mW.

The manual for mine (which is a little older based upon the schematics)
says that the small preset pot on the main circuit board half-way along
the side remote from the PA compartment allows adjustment of drive
level from 5 mW to 750 mW. Additionally, if you have less drive than
that, there are two pins near the pot that can be shorted together
to increase the transmit sensitivity to 0.1 mW to 15 mW.

My manual says the pot comes preset to a 500 mW drive level.

Adjustment is to apply a 28 MHz carrier and adjust the pot until the
transverter just draws maximum DC current. Nothing like maximum smoke
procedures. ;-)

I can only tell you that I own an FT-5100 for 2 years now and
it has been an outstanding radio. I had the expanded receive
mod done and that has worked out well too. We have quite a few
hams here in Northern Virginia that use that radio and I have
yet to hear a problem with it.

Good luck with whatever you do.

>run. Granted, variation in component values will result in slightly
>different PLL characteristics, but I have yet to see any evidence that
>suggests that the resulting fingerprint varies enough to be considered
>"unique".

Ok, here is more variables in the system, voltage, SWR, reactance, impedance?

One of my rigs is an HTX-202 (like 10,000) others out there. What do you
think would happen to the fingerprint if I ran on batterys, weak batterys,
12v from the car, on 13.8 with a smidge of ac ripple? Hi power,
low power, an antenna with high swr? Duck? An antenna with a capacitor in
series, started to tx while holding the antenna with my hand then releasing
it? When the radio is cold?

I would think that the fingerprints would be quite unstable unless you always
used the same exact antenna, voltage, temp, location...

I think that only permitting signals that had a matching fingerprint as
opposed to letting all signals except x,y,z would work better.

I would appreciate any information about current HF rigs which have the capability to adjust the output power down to 5 watts using the front panel power control or which can be easily adjusted to the 5 watt level using an internal pot. I think the FT 840 can be adjusted to this level using the front panel control.
Thanks,
Greg

SUBJECT: ** FS : WINDOWS'95 CD UPGRADE $50 **

I have still available a few Windows '95 CD-ROM Upgrade kits.

These are new, sealed, Microsoft Windows '95 CD-ROM Upgrade
Kits received with a computer order that I don not intend to use
with the computers they were received for.

These kits include the manual, CD-ROM disk, software registration
card, and Microsoft holographic Certificate of Authenticity.

The price is $ 50.00 each shipped by 2nd Day Priority Mail.

Send a check to :

Robert Reed WB2DIN
538 Brewers Bridge Road
Jackson, New Jersey 08527

TEL : (908) 363-2724

I will be selling the remaining Kits at the LIMARC Hamfest in
Frreport, NY on 2/25 and the Absecon, NJ Hamfest on 3/2 but
cannot be certain there will be any left afterwards.

From: wwhite@southwind.net (Wayne White)
Subject: Advice on Icom 751

Being a fairly new ham I am not as familiar with all of the HF rigs out
there as I hope to become. There is a member of our club who has upgraded
his station and will soon be selling an Icom 751. I would like any
information or opinion on this particular radio. I am particularly
interested to know if it is a good radio for CW work, if it has any known
inherent inadequacies, is it too much or too little radio for one with

little experience but high hopes and of course, what is an equitable
price for a used 751 in good to very good shape.

Any, and all help is greatly appreciated.

2M FM REPEATER EQUIPMENT FOR SALE:

The Denton County Amateur Radio Association (W5NGU)
is offering the following 2m FM repeater equipment
for sale:

Repeaters: (two available)
RCA Series 500, model C2CK7CJATDB03Y
Base/repeater with DC remote control

150 MHz, 60/100/115 Watt
1B-8028476
equipped with SYM 860 Auto Duplex Terminal

Duplexer: (one available)
Decibel Products DB-4060-WC-A
(can be converted to "B" model for 144 MHz)

Prices are negotiable. Equipment is located in
Denton, Texas, about 35 miles north of Dallas on
Interstate 35. Equipment was donated by FEMA.

From: "Gary P. Fiber" <gfiber@halcyon.com>
Subject: ICOM IC-2SAT HELP!?

>1) does this radio have a tone burst for reapeter use ,if so how
>is it operated?

On the 2SAT, 1750 Hz burst could be added if the serial number was below
about 9500, also the minimum offset tuning step size needed to be 25 kHz.
Here you would need to convert the radio to a european version and install
2 SMD resisotrs. After S/N 9500 or so the offset tuning was made
adjustable and the 12.5kHz tuning step was removed, also so was the ability
to have a 1750 hz tone burst. The reason was to free enough memory in the
CPU to have the adjustable offset tuning steps rather than the original
fixed 25 khz tuning in the earlier model 2SAT radios.

>2) my radio seems to have rx 100-200 Mhz and tx 140-150Mhz
>but the disply will read 0-1300 Mhz. does this mean it can
>be made to receive from 0-1300 Mhz if so how?

The radio will actually receive from 110 to 136 aircraft A.M. and 136 to
174 Mhz F.M. Signals above or below this range are usually overloads or
images. The tuning ability never stopped in the CPU program, how ever the
VCO never had the kind of range the frequency readout would report.

> other makes compare? Thanks.

Standard (Marantz) has always claimed excellent IMD rejection for their rigs.
As an
owner of several Standards, icluding two C5718DA 2m/70cm, I can attest to the
truth of
this claim. I live on a high hill, the very top of which is the highest
point in the
Milwaukee area. Within three miles are literally about 60 repeaters, for
everything
from 6m ham to 800 MHz public service, and everything in between. Also two
cell sites,
quite a few pager towers, several commercial broadcast towers, and a military
communications facility, complete with a camouflaged communications tower (it
gets "top
billing" as the very highest structure in the Milwaukee area, BTW.) In other
words, a
really, really IMD-prone area. I have yet to experience *any* IMD with any
of my
Standards - not even once - except on the 900 MHz band, which does get IMD
from the
really-close cell site (under a mile.) Luckily, the 900 MHz miltary radar
facility
that used to adorn my hill (across the street from the place with the
camouflaged
tower) is now a city park, along with the Nike missile launching facility at
the
hill's bottom. I can only shudder to think of the interference *that* would
cause.

Subject: Is there an all purpose TNC/Decoder?

Been a ham for several years......though yet to venture into packet. I'm terribly confused as to what TNC to buy. I won't say that money is no object, but, rather than buy several pieces of gear, I'd rather spend on the 'right stuff'. I would like a unit that would handle regular ham type packet, as well as decode other data transmissions, such as pagers, both digital and alphanumeric, DTMF tones, and other various data transmissions that may be occupying the airwaves here about the premises. Is there such an animal? If not, what various pieces of seperate equipment would one need. All help appreciated.

Subject: Kenwood Monitor: SM-220

Hugh Catlett wrote:

> SM-220 was made to be used with at least the Kenwood 830.

The SM-220 alone is simply a station monitor, without any panadapter functions. An additional circuit board is required to use it as a panadapter. There two such boards: the BS-5 and the BS-8. The BS-5 is for use with the Kenwood 500 series HF xcvrs, like the TS-520. The BS-8 is for later transceivers with 8.83 MHz IF.

From: Danie Brynard <danie.brynard@pixie.co.za>
Subject: Power adjustment on the TS-440S

I also had a TS440S. I agree you cannot vary the SSB output power on a TS440S except by controling the ALC voltage at the back of the radio. I built myself a little box for controling the ALC when I still had the 440, used it for QRP on HF.

The mic gain is a very unreliable and non-linear way of controlling the 'rf' power. It is not meant for that. Try using the mic gain when driving a 10mW transverter !

I went thru this whole story years ago - don't waste time with the mic gain control.

I now have a ts690s: kenwood decided to implement a rf output control on it, it works wonderful. Why have they decided to do it ? Make up your own mind.

>>on ten meters.
>
> 5 mW.

The manual for mine (which is a little older based upon the schematics)
says that the small preset pot on the main circuit board half-way along
the side remote from the PA compartment allows adjustment of drive
level from 5 mW to 750 mW. Additionally, if you have less drive than
that, there are two pins near the pot that can be shorted together
to increase the transmit sensitivity to 0.1 mW to 15 mW.

My manual says the pot comes preset to a 500 mW drive level.

Adjustment is to apply a 28 MHz carrier and adjust the pot until the
transverter just draws maximum DC current. Nothing like maximum smoke
procedures. ;-)

Source record: 205697

Does anyone out there have any information on down loading and up loading the icom u16 data stream. I would be nice to off load the u16 data to a computer, change the data and then up load again or upload another set of data.
I have done some examination of this data stream but have not made much since of it. Rather than reinventing the wheel, I thought that I might take advantage of the collective wisdom of the net.

best regards,
greg

What makes you think my description is in error, other than some other Icom radios are different? The mic jack audio out is derived from the top of the volume control, directly from the IF demodulator, as indicated by the schematic and block diagram. The block diagram indicates signal flow _to_ the volume control and mic jack (via a buffer amplifier), then it indicates signal flow _from_ the volume control to the speaker amplifier.

I believe my description is correct.

[The mic connector on the IC-2000 is an RJ (twisted pair/telco style) connector, I doubt that headset that plugs into the IC-735 would plug in ;-).]

thanks for the note!!

Dana

I have four lower-end PCs for sale. Great for communications work,
basic word processing or spreadsheet work. The 286s are Windows-capable.

1)Toshiba T1200 laptop, dual floppy, no HD, comes with case, manuals. $100

2)Mitsubishi 286, 40M HD, 1.2 5-1/4 floppy drive, 1M RAM, CGA graphics card, $90
3)Mitsubishi 286, 40M HD, 1.2 5-1/4 floppy drive, 2M RAM VGA graphics card, $100

Both of the above are very nice, clean, compact machines

4)NEC Powermate 286, 40M HD, 2M RAM, 1.2 and 360k 5-1/4 floppies, VGA card, $100
Excellent shape

Monitors for your new machine(s):
Aamazing 14" VGA color monitor, great shape $130
NEC 14" CGA color monitor, very nioce unit $100

Will make package deals!

Sorry Dana, but this is in error. There is a fixed-level audio output
pin in the ACCESSORY plug in the rear of many Icom radios (735, 740, and
751 rigs are my experience). The level is high enough to operate HF
digital operations with PK232s and KAMs (although it is not enough to
drive the PK232 from my 751 when the '232 is in Morse code - not that it
much of a concern for me. However, the audio output derived at ICOM
mike jacks is adjustable with the volume control. I can confirm this
because I have the Icom Boom/Headset mike and it works with my former
735, and currently owned 751, 706 and 2310 (UHF/VHF mobile). If however
it is the case for the IC-2000, it would seem that this is peculiar to

this radio.

My apologies - I did not wish to discredit your schematic interpretation
abilities whatsoever. It struck me odd, however, that this rig would seemingly
have a different configuration from the rest of the Icom family of radios,
as I noted in my last comment of my original posting.

>The mic connector on the IC-2000 is an RJ (twisted pair/telco style)
>connector, I doubt that headset that plugs into the IC-735 would plug
>in ;-).

From your description, sounds like Icom used the RJ-45 connector,
which is used by the telephone industry, so I have been told, as a
"data jack". This is the type of jack that is also used on the 706. But

you are right, here I was with the Icom boom-headset with the radial 8 pin plug and in accordance with that Law of Physics that says you can't put a square peg in a round hole, it didn't fit. As well, the stock 706 does not come with a DTMF pad on the mike (when told by an Icom America rep that DTMF mikes were over $100 a pop and the inclusion of one would have thrown the target price for these radios out of whack, I didn't have the presence of mind to remind this individual is that what he was quoting was the retail price, not the actual value of manufacturing - which is probably in the order of 10 bucks - but I digress). So I had a couple of 8 pin radial jacks, and rooted around in the shack for a mini-DPDT switch and scrounged a curly cable with an RJ-45 plug on it, went to Radio Shack and bought a little perf board and one of their blue experiementer boxes. After careful wiring, and a lot of swearing and making sure I did not poke my eye out with the soldering iron and Voila! I now have a little adapter box, in which I can plug my boom headset and an Icom mike with DTMF pad and it is switchable. So far, it seems that the boom mike has better audio, according to the tests I have been doing so far. But when I want to make an autopatch, I just flip the switch and use the DTMF pad on the other hand mike.

So it is possible to use headset that was used on my 735, but a little adapter is necessary. (I understand that Icom has an adapter ready made, but I read somewhere it is $US45, which would put it at the $CAN65 range. It wasn't worth it.)

73 and live better digitally
Jim, VE3XJ

Yes, I faced the same problem with my 706, coupled with the fact that the 706 stock mike does not have a touch tone pad
thanks for the note!!

ken or john,
i'm interested in the micor uhf repeater. but i don't know too much about them. all that stuff you listed, does that mean i would just get the right frequency pair and i would be able to put it up or is there more parts i'll need?
i do have cavities awaiting to be tuned to the frequency allocated by the local frequency allocator. but i want to run it from my home, and i need to know what all i'll need. i'm not quite sure what kind of controller is needed or if that's included. i don't know what all the parts you have listed are. but if it's complete, less the crystal frequencies, i'm very interested.

if you could fill me in a bit on setting it up i would be very appreciative, i've read a lot about them, but it's still not very clear to me.

i was going to get 2 radios (old rock bound radios) and try doing that, but i have heard that the micors' are made for it. please excuse my ignorance, but i'm learning. any help would be great!

thanks a lot

>over the other.

Hi Michael, I've used both radios. I actually prefer the FT-11. For one, the FT-10 has a non-standard antenna connector, so I foresee problems hooking it up to car roof antennas, etc. Second, I'm not so interested in the ruggedness of my HT as I am features. The FT-11 has more features, and it's a lot closer to the FT-51R, which is my favorite of all the Yaesu radios.

Just my two cents.

<begin shameless plug>
And whichever one you end up with, please check out EZ Clone. EZ Clone is software for programming the settings and memories of handheld radios. It will work with both the FT-10 and FT-11. More info is available from:

Source record: 205560

Hi Peter. I agree with the previous comment -- re it depends on the calibration and accuracy of the S-meter circuits in any particular rig. In general most reference books state that an S-unit is 6DB. Thus a power increase of 100 W to 200 W is 3dB and 200 W to 400 W is another 3 dB, so 100 to 400 would by theory gain you 1 S-unit.

However, if you can get your signal up out of the noise by 1 S-unit it can make a big difference. Generally, on 20M, it is very difficult for me to work Europe with 100 Watts and my R5 antenna. With an AL-811A at 600 Watts, however I have much much better results. On the other hand, old man propagation calls the shots as well. During the last sunspot peak, I was able to work several Europeans SSB with 6 Watts (playing at QRP here).

Most Dxer's will advise putting efforts into maximizing your antenna first by getting a gain antenna and a good low angle of radiation, -- a whole other subject. I would much rather have a beam at 60 + feet then an amplifier and a dipole HI HI.

Many new users come *DIRECTLY* to this group, and either don't KNOW where to find instructions, or don't even know they EXIST! Upon reaching this group and seeing other for sale listings, they feel no guilt in placing their own. Before someone climbs up on their soapbox, and begins lecturing the newcomers, I would ask a question: WHY is it not possible at the heading downloaded to all checking into this, and other groups, to include a *BRIEF* one or two sentence outline on WHAT is, or is NOT proper to post here? At least THAT way, ALL users would see the info at first access to the group. Too logical, perhaps... :-)

The mod is easy. This will give you 137-174mhz and 410-470mhz Tx/Rx.

1. disconnect power and antenna (like, you would'nt of done it already.)
2. open up the case by removing the screws and gently removing the cover and unpluging the speaker.
3. locate and CUT the GREEN WIRE on the CONTROL BOARD (the vertical board behind the control panel.
4. reassemble the radio.
5. RESET THE MICROPROCESSOR (so much for the memory!)

(press and hold [D/M] & [REV] & [ENT] & turn the power on (got enough fingers?).

(turn off the radio).

(press and hold [SCAN] & [HOME] & turn on the radio (extended RX mod).

Tha, Tha, Tha, That's All Folks!

Have enjoyed all the posts about QSK. Jack (WB3U) mentions that
the key to good qsk is to somehow "center" the "chopping" in-between
the RX and TX window. I agree...but isnt this dreaming a bit?

I dont know about you guys, but I use QSK almost always and find that I
prefer if my sending signal is perfect and RX is ok. In otherwords, I'd
prefer the RX to suffer when running at 45 WPM full bkin and have my
sending go out perfectly. The perfect QSK cw is important when you are
trying to crack a pileup (or just for good copy on the other end) Being
on this end of the pileups, I find it much easier to copy clean "qsk" CW
than chopped CW. At 45WPM, the effectiveness of hearing between every
single dit is not so significant. I cant stop my hand on the
paddle just as I copy that CW between my dits...reaction time just isnt
that good. However, hearing between letters is mandatory. In summary,
then, I'd like the manufacturers to make "flawless QSK transmitting with
adequate rx breakin to run 45WPM and have some degree of AGC/receiver
recovery between dits but PERFECT AGC recovery between letters. Problem
is, most rigs cant even do this very well at the 45+ WPM speed.

Just my 2 cents worth. 73 and thanks for the enjoyable discussion.
Joe

Greg,
To my knowledge, all Kenwood solid-state HF rigs can be turned down to near-zero power, going back to the early ones like the TS-120S. I've owned TS-130S, 430S, 440S, 850S, and now an 870S, and all went down to virtually zero power just using the front panel controls.

I've heard that many Icom and Yaesu rigs will only go down to ten Watts or so without modification. YMMV.

From: n4lq@iglou.com
Message-ID: <DMtyus.Cut@iglou.com>
Source record: 205637

I've using the IC-706 on Pactor, opperating in the real FSK mode.
I'm here to report that it works wonderfully. I had a nice Pactor qso on
80 meters with another staion over 1000 miles away who was practically
inaudible. Amazing throughput and I didn't even kick in the 500hz filter.

Results were much better than with my TS-940. I noticed that the cw
monitor is turned off on the 706 while in fsk mode. I was accustomed to
monitoring my outgoing chirps on the 940. No big deal though.

Cross posting here to rec.radio.amateur.equipment from
rec.radio.amateur.misc. thanks, Joe

Joe Fitter BV/N0IAT <FITR%mimi@magic.itg.ti.com> wrote:
Hi Bryan,

I've had one of those rigs for about 8 months with no reports
of problems. However, I own the DX-70 Japanese model
(not the T model, so my unit did not come with CTCSS).
I have had no problems with the unit in FM -- reports are
consistently good . As the other
ham suggested, perhaps RF is getting into your radio. Here is
what I would suggest for starters, to eliminate the obvious:

a. Does the hum change if high or low power? You need to
work a station who is close enough to be "full quieting FM"
on both high and low power. RF may be getting into the rig
or the microphone on high, but not low power.
If it goes away on low power, it could be RF in your rig or
more likely into your power supply.

b. Can the new power supply handle 19 amps of current continuously?
My rig draws about 19 amps on FM...which is a continuous duty

mode. Could be power supply hum if not hefty enough.

c. Are you using the Alinco microphone? After-market mic's
(especially electrec condenser mic's) can be prone to rf
and cause a hum in the transmission.

d. You mentioned CTCSS. Does the hum persist even after you turn
off your ctcss encoder? Go simplex with a buddy to find out
if your FM rptrs require CTCSS to access them. Or, just have
a buddy listen to your input frequency with and without CTCSS
encode.

e. Does the hum change frequency (pitch) when you change the dip
switches on the ctcss encoder board? If so, then the
deviation
on the CTCSS board may be set too high. There is a small
surface mounted resistor on the ctcss board. Open the
underside
of the radio and adjust the ctcss level...you can do this if
you
are careful without the aid of test equipment.

f. Is the VSWR below 1.5:1 at your rig and antenna? VSWR can
sometimes cause funny things to happen to surrounding shack
equipment....which can induce a hum into your FM rig.

g. Does your rig sit on top of the power supply? Some rigs can
pick up the "hum" of the power supply even though the mic is
far from the source of the hum. Move the rig off of the
power supply.

These are some ideas...have had problems with hum before, but "usually a
quick lesson to teach the radio all the words" solves the humming
problem (sorry...old old joke couldnt resist).

Good luck and keep us posted on your findings.

73, Joe

Posting-Frequency: posted on the 15th of each month

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

2341. C5900DA - RS232 port?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-15 00:00:00 UTC
From: mcnerney@programart.com
Message-ID: <4fv6em$ik2@sundog.tiac.net>
Source record: 205640

I was interested in Standard's new 6m / 2m / 70cm tri-bander which
is advertised in the March CQ-VHF. Does anyone know whether
it has an RS232 port so that it can be controlled / configured from a
computer as can Yaesu's Ft-8500?

thanks!
-bob

2342. IC706 CW filters: 250 vs 500?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-15 00:00:00 UTC
From: wilson@afn.org
Message-ID: <4fvbfg$69a@huron.eel.ufl.edu>
Source record: 205641

Does anyone know the 60db bandwidth of these filters. I emailed ICOM,
but got their typical no response. I guess this question may be moot;
I'm not sure the 250 Hz filter is available.

2343. Yaesu FT-530 price drop down to $298 from AES

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-15 00:00:00 UTC
From: crum@xmission.xmission.com
Message-ID: <4g0c71$iku@xmission.xmission.com>
Source record: 205642

So, I wonder why AES dropped the price of the Yaesu FT-530 dual-band handheld radio down to $298. The guy I talked to (at 800-558-0411) said that this price "is not listed as a closeout price at this time." Hopefully this means that a new model FT-50R is coming out soon! Anyone have juicy rumors out there?

2344. ICOM IC 706 AIRBAND-Transmitter 10 Watt

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-15 00:00:00 UTC
From: aust@gandalf.sp.TRw.COM
Message-ID: <9602151550.AA22733@noldor>
Source record: 205643

The IC-706 was puposely designed so it would not
transmit in the VHF AM AIR-BAND. I am suprized at
such a request.
Icom make excellent aircraft portable transceivers,
and for lower cost than the IC-706, you can get a type
accepted radio.
Can you imagine a new ham , pulling out a diode,
redirecting 747 , 757,s jets to the wrong runway.
This would cause an international crisis. The outcome
would be very serious!
If anyone knows of such a mod, do not post it here,
this request of an Aircraft Transmit Mod for the IC-706
is one of non-responsibility, violation of laws in
many countries.
Please be resonsible here, not all the people here asking
for mods, may not be hams!!
Also, thing of your actions before you volunteer such a
modification.
That's all we need is hams on the Aircraft band.
Let's ignore such requests!!!!!!!!!!

I ask the Icom rep at a local hamfest why it doesn't transmit VHF out of
band (I was interested in CAP frequencies). His reply is that they didn't
way the radio to transmit on AM aircraft frequencies, which is what I
guess would happen if the radio was able to be modified (why that cannot
be blocked with software and the microprocessor I don't know). That's why
it cannot be modified and Icom has no intention (at this time) to make one
that is modifiable.

>proper to post here? At least THAT way, ALL users would see the info at
>first access to the group. Too logical, perhaps... :-)

The problem is those nasty web browsers. They weren't designed to
do that, and they don't have the newsgroups file to draw from. Now
on my site I handle things this way. I make the group FAQ article
number 1, and I change ownership of the file so that expire can't
touch it. That way, anyone joining the group for the first time
sees the FAQ as their first message. Any news administrator could
do the same on any news server.

For a brief description of the group, my system newsreader can draw on
the newsgroups file on the system, but that only works for shell accounts
of course. I also have the system newsreader setup to *force* setting
of the Distribution line for each message, something else you can't make
the browsers do. It's pretty obvious that the browser authors don't
understand usenet netnews, and have managed to break many of its built
in management features (use of nntp over the internet doesn't help
matters either since it can really bollux the distribution system).

2346. *** Need info on latest handhelds (esp. toneburst)

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-15 00:00:00 UTC
From: hardie@duke.usask.ca
Message-ID: <4fvt57$7sj@tribune.usask.ca>
Source record: 205645

I'm hoping to buy a dual-band handheld very soon but would like some info.
I notice that most of them advertise (in North America) built in CTCSS and
some even have DTMF paging functions. However, they do not mention if they have
the European 1750 Hz toneburst feature built in. My old FT-208R has a space
on the board where the chip for this function would be in the European version
and I had to add my own circuit to generate the toneburst.
Do these recent do-almost-everything handhelds have the toneburst in them?
I'd rather not have to build a circuit for it again - and I'm not that good
at whistling the right tone.
And while I'm at it, if you have a recent dual-band handheld please Email me
your likes and dislikes about it (no need to clutter the group with this :-)

I'm looking for an inexpensive HF receiver. Perhaps this is in
a FAQ or web page.

I'd like to have SSB (and morse?) and external antenna. I'd like to
use it to receive weather fax and SITOR transmisions, as well as
voice.

Could I get some opinions on what to get?

I've seen these:

Grundig Yacht Boy 400, $250
Sony ICF-SW100, $300
Sony ICF-SW7600G, $200
Radio shack DX-390, $220
Sangean 803A, $200
Panasonic RF-B45, $200
Panasonic RF-B65, $269

>type packet, as well as decode other data transmissions, such as pagers,
>both digital and alphanumeric, DTMF tones, and other various data

I haven't seen anything that did pagers, but if you're interested in a wide variety of signals (i.e., not just packet and sstv/fax/rtty/amtor etc), you might be best off with a DSP rig such as AEA's DSP-2232 (model number?)...

Could someone who knows about such things continue on this point? Have people written "interesting" modes for the AEA DSP rig?

2359. Kenwwod TM733 problem on packet?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-15 00:00:00 UTC
From: mparkes@aol.com
Message-ID: <4fvgea$r24@newsbf02.news.aol.com>
Source record: 205658

I am using a 733 for 1200 baud vhf packet and it seems to work quite well, except one friend that I have trouble connecting to even though we both have good signals...I tried adjusting the afsk level from my KAM to the 733 lower, and was able to find a point at which I could now connect to him fine, but on listening to my own signal it was obvious that my afsk tones were actually too low, sort of down in the noise. So I went back to the level they were at,. OF course now, I am right back to the same trouble with my friend's staion. (BTW I found I had trouble connecting to at least one other staion with the lower afsk level so that isn't a viable solution).

Is there something on HIS end that could be causing the trouble? He doesn't seem to have too much trouble connecting to other packet staions usually..

Thanks fior any advice on this! Mike KS4DA

The following article is considered to be in the public
domain and may be re-published, copied, or distributed without
prior permission. Credit to the original author will be
appreciated.

****

REDUCING 6-METER SPURS FROM THE ICOM IC-735

After assembling a Ten-Tec 1208 6-meter Transverter
Kit and connecting it to my Icom IC-735 transceiver, I noted the
presence of in-band (6-meter) spurs which apparently were coming
from the IC-735. Some were fixed frequency while others "stepped"
as the IC-735 was tuned, and they ranged in amplitude from near
noise level to S-8. Removing the microphone eliminated many of the
spurs, so it was obvious that they were being radiated by the
cable. Further tests verified that the PTT, PTT return, and UP/DOWN
pins on the mike connector were the worst offenders. The cure is
to bypass these pins inside the IC-735.

To accomplish the internal bypassing, remove the top and
bottom covers of the IC-735 and lay it on its top with the front
panel facing to the left. This puts the mike connector on the
observer's left and immediately in front. Behind the mike
connector is a small, vertically-mounted circuit board, and
pointing towards the observer from this board are several small,
green RF chokes in approximate vertical alignment. These chokes
are, from top to bottom: L8, L7, L6, L5, L4, and L3. Three bypass
capacitors should be installed: 0.1 ufd to pin 6 of the mike
connector (PTT Return), and 0.01 ufd to L8 (PTT) and L6 (UP/DOWN).
The free lead of each bypass capacitor should go to chassis
ground via a solder lug under the nearest PC board holddown screw
on the large board mounted to the underside of the IC-735.

Install a 0.1 ufd capacitor to pin 6 of the mike connector by
making a small loop in one lead of a capacitor (cut the lead to
about 3/8" long first), bend the loop 90 degrees, then slip it over
the pin. Reach in carefully with a small soldering iron (25 watts
or less) and "tack" the lead to the pin. USE EXTREME CARE NOT TO
TOUCH THE PLASTIC RIBBON OR ANY OTHER INTERNAL COMPONENTS OR WIRES!
Connect the other end of the capacitor to the ground lug.

RF chokes L8 and L6 are mounted vertically to the board with
the outer-most lead looped back down to the board. Alternate loops
have insulating sleeving on them, but the loops of L8 and L6 (top
and third from the top as viewed by an observer) have no sleeving.

Make a small "hook" in one lead of a 0.01 ufd bypass capacitor (cut the lead length to about 1/4" or so), hook it over the wire of the loop, and tack it with the soldering iron. Connect the other end to the ground lug. Repeat the procedure for the second RF choke.

After installing the three bypass capacitors most spurs were eliminated, while the strongest of the original "carrier-type" spurs (50.100 and 50.200 MHz) were barely audible at the noise level. The synthesizer "step" spurs at 50.121 and 50.225 are no more than S-3 and there are no other spurs of consequence in the range from 50.100 to 50.225 MHz. The modifications have no apparent adverse effect on operation of the IC-735.

Paul Bock, K4MSG

IC-2GXAT Keypad Receiver Modification

1. Turn off the radio
2. Press and hold the Function, Scan and Dup buttons.
3. Continue to hold the above buttons for 5 seconds after turning back on the radio.
4. Release the above buttons, now the IC-2GXAT will tune from 136 to 174 Mhz.

There is no direct keypad frequency entry modification and the IC-2GXAT will not d Air craft A.M. receive.

Have Fun

2367. Information on equipment sought by new Tech

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-16 00:00:00 UTC
From: tomz@premier1.net
Message-ID: <DMuJuB.GLH@data-io.com>
Source record: 205567
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space

Hi,
I am going to be taking my Tech tests on Saturday (2/17) and am now starting to look in to what type of radios to get. I plan to put a 2M Mobile in my truck and get a more substantial base for home.

For home I'm looking into Base Multiband / Multimode Transceivers and trying to decide what will be my best bet. I was thinking of one that would cover at least 2M and perhaps 70cm. I am interested in working into Satellite and EME as well as FM and perhaps some local CW, 12V operation would be a plus but not a major requirement. I do plan on upgrading to at least General with in the next year and expanding also into some HF as well. So I would want to take that into consideration as well. possibly using Transverters get to the higher freqs for satellite and EME and going with a more basic UHF/VHF base unit.

For the mobile unit I was thinking of a rather simple 2M unit for repeater and simplex FM. I live in a rather remote area in the western foothills of the Cascades so I think one of the higher output power units would be in order. I was considering picking up one of the new Radio Shack units. As far as I can tell it has most everything I am looking for at a reasonable price. From the cross talk I have seen on the net and the write up in CQ (VHF) it seems to be a good choice.

I would like to take advantage of the wealth of experience of those out here on the net and get some input from you as to what you think. Suggestions on equipment to get or avoid as well as things to look for or useless features to not even consider. For me price, value and reliability are important, I have a modest but hopefully adequate amount set aside for starting up and want to use it wisely. The Base unit I'll be looking for used at up coming Ham fests so any information about current or older equipment would be helpful. I was thinking of picking up the Mobil new (if it is in or around the same price range as the Radio Shack unit) but am vary open to suggestions. I would also welcome comment on other accessory gear that you feel would be useful as well as thoughts on band selection (pros and cons of the diffrent amature bands) or what ever info. you would like to pass on to a newbie like myself. I know there are lots of books and other sources around and would not mind pointers to the better source like that, but I am primarily looking for personal insights and experience.

Thanks
TZ

Actually it's bad form to post ANY mod that violates TA of the product, like out of band HF mods.

Half the people that want those mods are the SSB CB idiots that operate outside the band and use amateur equipment. Not only does it encourage CB use of Ham gear, if the FCC ever got a complaint the manufacturer could be in big trouble.

Normally I don't take much notice of FOR SALE ads in this group, as they aren't supposed to be here anyway. But this one raised my curiousity. My RH-250 by Regency covers 150 to 162MHZ, and the front keypad has no ability to generate DTMF tones. It will program the unit (w/ J401 Uncut) and controls various operations. But DTMF? Wow.

Or do you mean that you've added an aftermarket DTMF pad to the unit?

Never seen one of these sell used over $100. A nice enuf little mobile - CTCSS/SCAN/PROGRAMABLE. But susceptible to intermod, cheaply constructed and the finals were not well heat sinked. Commonly the power switch and the finals go out. Properly installed, it's reasonable to get 20 to 23 watts out of a new set of finals. The trouble was that Regency and Wilson who also made this radio both failed to provide a proper heat sink for the finals and often left out the silicone heat sink grease.

Suggest posting this to rec.radio.swap where lots of folks buy-sell-trade radio stuff. I'd be very interested in hearing what it finally sells for too. I plan on selling mine soon and have 2 Wilson WU1510 UHF versions to get rid of as well.

Actually, there is absolutely nothing wrong with modifying radios. The FCC frowns most severely on transmitting from said radios outside of the amateur bands. They also look upon the fact that the radio was modified as proof that the radio has been used out of band. Now that's very rude.

Transmitting on the AM Air-Band? While none of my radios is modified, I have read thru the various mods and none can make the radio transmit down there. Receive yes. Transmit no. I'd be greatly surprised to hear that the 706 could be made to do that. Rather useless if it could. The Air Band in question is AM, not FM. When I listen to such transmissions using FM demodulation they are quite lacking in readability. So why bother?

Strictly in terms of practicality, there are many good reasons to modify radios for out of band operation. But that doesn't make the use of these toys legal, so best not to mess with it. The bit about CB'rs using modified HF radios or modified CBs to yack in the HF bands is one that I certainly wouldn't like either. I once bought a used Palomar SSB-500 CB (over 16 or 17 years ago). Lots of switches for assorted interesting "noise reduction" features. But try and use these switches and you were suddenly off on something like "Channel 64". The radio had been designed to easily do these tricks. The prior owner didn't tell me he'd done the mods. Took me a while to figure out what the heck was going on and straighten the radio out. Good radio actually. Still have it. Wonder if it would convert over to 10meters?

Well, that's nice. Suggest adding info on what sort of Amateur license you hold, and what your interests are. Do you want to communicate around the world or around the neighborhood? The different answers to this question will point you in different directions. What do you want to use these radio toys for?

Other than that: Try first doing LOTS of listening. I know some amateurs who listened to their toys for weeks before they ever began to transmit. Helps you develop a feel for the hobbies better (and not so much better) practices. Then you can start up not making quite as many newbie mistakes as might otherwise ocurr.

Have fun out there,
Chris - N7RME

Hi,
I am going to be taking my Tech tests on Saturday (2/17) and am now starting to look in to what type of radios to get. I plan to put a 2M Mobile in my truck and get a more substantial base for home.

For home I'm looking into Base Multiband / Multimode Transceivers and trying to decide what will be my best bet. I was thinking of one that would cover at least 2M and perhaps 70cm. I am interested in working into Satellite and EME as well as FM and perhaps some local CW, 12V operation would be a plus but not a major requirement. I do plan on upgrading to at least General with in the next year and expanding also into some HF as well. So I would want to take that into consideration as well. possibly using Transverters get to the higher freqs for satellite and EME and going with a more basic UHF/VHF base unit.

For the mobile unit I was thinking of a rather simple 2M unit for repeater and simplex FM. I live in a rather remote area in the western foothills of the Cascades so I think one of the higher output power units would be in order. I was considering picking up one of the new Radio Shack units. As far as I can tell it has most everything I am looking for at a reasonable price. >From the cross talk I have seen on the net and the write up in CQ (VHF) it seems to be a good choice.

I would like to take advantage of the wealth of experience of those out here on the net and get some input from you as to what you think. Suggestions on equipment to get or avoid as well as things to look for or useless features to not even consider. For me price, value and reliability are important, I have a modest but hopefully adequate amount set aside for starting up and want to use it wisely. The Base unit I'll be looking for used at up coming Ham fests so any information about current or older equipment would be helpful. I was thinking of picking up the Mobil new (if it is in or around the same price range as the Radio Shack unit) but am vary open to suggestions. I would also welcome comment on other accessory gear that you feel would be useful as well (for example band selection for Satellite and EME), or what ever info you would like to pass on to a newbie like myself. I know there are lots of books and other sources around and would not mind pointers to the better source like that, but I am primarily looking for personal insights and experience .

Reply here or by e-mail to tomz@premier1.net

Thanks

For the receive-only listener, check the M-8000, M-4000 and M-1200
decoders offered by Universal Radio, Inc. Each includes some of the
common paging formats in addition to RTTY, AMTOR, etc. Certain of
these decoders also include DTMF and AACARS. The price ranges are from
$1350 down to $400.

Universal can be reached at (614) 866-4267 (Columbus, Ohio).

> Panasonic RF-B65, $269
>
I think the best relatively cheap receiver is the Lowe HF-150. I sells for about $500 in Europe. O.K. it's a bit higher in price than the above. But especially if you want to connect an external antenna, most of the regular small radios like the ones above quikly get overloaded by strong broadcast stations (lots of noise everywhere on the band).

Secondly the SSB reception is excellent. Very good sound quality and stability, the latter being important when receiving and decoding things like FAX and SITOR.

It's very bare to the bones and doesn't offer features like (alarm) clock and dial light, but every penny has been spent on performance. It has though holders for recharcheable batteries. And you can buy several options too.

>I need a general coverage Xmit mod for my Yaesu FT-840 Please help

1. take off bottom and top covers.
2. connect a jumper from point TP2003 to ground. this is temporary
while preforming the programming steps. that point is in front and to
the edge of the lithium battery.
3. with the ft-840 off, press and hold the (SSB) & (AM) buttons at the
same time. turn on the rig, then release the buttons simultaneously.

4. the display will show (02-ON). press the (AM) button to confirm
setting: it should read 7.000.00 LSB. turn rig off.
(If the rig does not show 02-on move the main freq knob to change it)

5. press and hold in the MEM , (DOWN) and (UP) buttons while turning
rig "on".
6. turn pwr off, and remove jumper.
7. if you have a problem, dump the backup memory by switching the back
up switch off per the manual.you can then redo the steps.

If you know of any mods please let me know and if you can find out what
01-ON/OFF to 09-ON/OFF i think it goes to, what do the other settings do.

Hi Tom, if you are dealing with 50 ohm systems, you can easily measure the power into the tuner and the power out of the tuner. A network analyzer will also do the trick. If your question is: How does the average ham know how much power his antenna tuner (and balun) are consuming while radiating RF from an antenna, then the answer is not so easy which is why a lot of hams waste 1/2 or more of their power.

Here are my rules of thumb: 1. Never operate your tuner or balun in the right half of the Smith chart. 2. If you can possibly achieve a Z0-match on the antenna side of the balun, do it.

N5AQM and I proved that following the above rules-of-thumb bought me 5 dB on 75m. I don't know how that 5 dB was split between the tuner and the balun.

> are useful for MARS operation, and may be useful for emergency
> use.

Not quite true.
The IC-706 does indeed carry FCC Part 15 Type Acceptance. The receiver because it operates over 30 MHz must be complient with FCC Part 15. The Amateur radio transmitter is not type accepted or approved. The manufacturer only needs to comply with FCC Part 97 for the transmitter. On HF radio noyhing is Type accepted or approved. The FCC really does not care, only the transmitter complies with FCC Part 97. Also that the manufacturer follows the FCC letter of intent sent to manufacturers a few years back. Any transmitter must not be presented as useable in a service it was not Type Approved For. Only H.F. Linear Amplifers must pass Type Acceptance, And scanning receivers that operate above 30 Mhz must pass Part 15 RFI standards.

Where you get into trouble operating an out of band radio is as an unlicensed station. If the radio is not Type accepted for the other service it then is not licenseable for that service. So even in an emergency if some agency wanted to make a stink, one may just get pinched for operating an unlicensed station if you suddenly appear on the local police frequency. Also in other servicec other rhan amateur the transmitter is certainly Type Accepted along with the Receiver passing FCC Part 15 rules. The FCC is also notified about the exact numbers and models of All amateur products imported into the United States, but they do not care about serial numbers though.

Gary

copied from packet:
MSG # TR SIZE TO FROM @BBS DATE TITLE
6421 B# 2878 MODS N9EWO ALLUS 960215 YAESU E-DC-12 DC Adapter Chg.Mod.

Hello , and many thanks for taking the time to read this packet........

YAESU E-DC-12 Mobile Adapter /Charger is the new gadget that
connects on the bottom of the Yaesu FT-51/11 series transceivers
for operation of the these H-T's via the cigarette lighter socket.

This slips on to the current battery in use using the bottom contacts on the
radio. The DC operation is the most desired feature. The trickle charger
is not (at least for me). I try to charge my Ni-Cad packs as you are
supposed to, that is NO charges in the middle of a discharging cycle.

Well if you slip the E-DC-12 on in your car (for DC operation) ,it will also
give the battery a charge as well. Bad for the battery. No switch is on the
unit to disconnect the charge circuit either.

So the easist and best way I found was to just open the E-DC-12 (4 screws)
and remove the 1 wire that goes to the charge circuit. Guess you could add
a switch here if you wanted to ?? I just removed mine as I do all of my
recharging in the NC-50.

After you take out the 4 screws , the case will sort of spring open, the +
connection is made via a spring. Be careful not to break the - wire, it's
quite short. All you need to do is to disconnect the "WHITE" wire. Insulate
it,and no more Charge circuit........I like it better this way......and can
be reconnected later with no problem......

2403. ICOM 737-A For Sale

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-17 00:00:00 UTC
From: rroberts@mcs.net
Message-ID: <NEWTNews.824597357.10933.rroberts@rroberts.mcs.com>
Source record: 205520

Greetings All.....

I have an ICOM 737-A with VOX and Automatic Antenna tuner for sale.
The rig was purchased two years ago in January at the Wheaton Hamfest. It has been used mostly in the house but has been used as a mobile rig as well using a Hustler antenna system.

The only reason that I am selling it is that it is to big for use as a mobile rig in my car. Since it would be easier to get a smaller HF rig than a new car

(although almost as expensive HIHI, I first need to sell this rig before I get a new one.

The rig has been modified for MARS Operation, and I have the manuals,mobil power cord and hand mike.

I am asking $900.00 for the radio, however I will discuss "serious" offers as this radio has less than 100 hours total time of use.

Please address all mail to me direct and not to the news group. I will answer all inquiries made to me via direct. Shipping can be worked out. Weight of radio is approx.17lbs.

Thanks in advance.

Rich

The receiver is indeed subject to Part 15 "notification", but this
isn't "type acceptance" and has nothing to do with the transmitter
as you point out. Part 15 "notification" basically means the manufacturer
sends the FCC a form saying they've tested the receiver for compliance
with Part 15 standards and it passed. ;-). Type acceptance is considerably
more involved.

>Where you get into trouble operating an out of band radio is as an unlicensed

In an emergency, which the FCC defines as "property or life in imminent
danger", you're legally allowed (under FCC law) to use whatever means
necessary to get help. However, some local jurisdictions have more
restrictive laws. Me, if I thought I had a bona fide emergency, I would
not hesitate to use whatever means necessary.

Hello person. The best place tot start is to head tto your nearest ham radio store and pick up one of the many publicattions for people interested in ham radio and read it cover to cover. Then work on getting your first license through a local club. usually theyu offer classes for getting started and lots of fantastic, practical advice. When you are ready to buy equipment once you are licensed, the club members will be extremely helpful guiding you to a good system. Good Luck WB7OWF

Source record: 205594
Cross-posted to: rec.radio.amateur.equipment,uk.radio.amateur

I have been offered an HP 8660B (Keyboard Mainframe Sig Gen), including the appropriate Mod and RF Sections, but the unit is a mystery to me. It looks just like the 8660C but I can't find this B model in any of the H-P T&M catalogs I have access to. I can only see A's C' and D's through 1989.

Has anyone heard of this instrument and can tell me any and all differences bewteen the B and C models? I heard that one must throw an internal switch to tell that mainframe of a change in RF Section tuning range, while it is automatic in the 8660C, but that is about all I know.

Regards,

Hi,
First I would be sure to get a unit that does both UHF/VHF. There are now more UHF repeaters in some states (Texas for instance) than VHF! The Yaesu 5100 is a good choice as are some of the kenwood, icom, and alinco models. I like the one that allow for 2 V's or 2 U's as well as a V and a U at same time.. so look for that.

For satellite work you need All mode rigs (CW/SSB).. they are considerably more expensive than the FM variety. You can use transverters from an HF rig, but you will lose features like auto doppler shift correction etc. AND if you want to work some of the satellites that have UHF/VHF/HF capabilities it becomes difficult with the transverters in line.. but not impossible.

Get a good FM Dual bander... learn about the hobby from a local club, see if others are into satellites and find out what works for them. Grab the general/advanced and then have fun!!

73 hope this helped a bit.. perhaps others will comment.

If you want to join our listserver (we are in Houston TX) you may do so and post your question out there... to subscribe

email to listserv@mailserv.phoenix.net
<no subject)
sub clarc
<blank line>
<send it>
Then after you have subscribed, send your questions to
clarc@mailserv.phoenix.net

To unsub, repeat above and say unsub clarc

Several of our members are into satellites.

>Thanks for any info. 73

I've had one for about 4 months and I like it. The receiver is more
sensitive than my DJ580T and the battery lasts longer (on receive)
too.

BTW, To open the receiver press the B and # while turning on the
radio. Wait for 5 seconds before you release these buttons. This is
the only mod I know of.

73,
John

Hi Bill,

Order the CT-30 "Y" adaptor from your dealer or Yaesu. It runs around
$9-$10 and converts the single jack to a standard twin plug which is
easy to hook up to packet stuff.

>
> <<<<<<tyoei@eworld.com>>>>>>>

What you need to send messages using a transmitter is:
vocal chords
tongue
mouth air
microphone
antenna

Now attach both the antenna and microphone to the transmitter.
using air from your lungs, form words with your vocal chords.
Talk into the microphone. (with the PTT pressed)
You are now sending a message to another person.
Release your PTT and place your ear close to the receiving speaker.
your are now receiving (maybe) a message back.

The Radio Shack mobile is Ok, but wait for it to go on sale. There are
many other 2 meter radios that will also fit your needs. The used market
will offer you the best value. For example, the IC-28H was one of the first
"high power" compact 2 meter mobile rigs, and it is available used at
attractive prices. However, you might want to think twice about other
miniature mobile rigs if you need high power. While the IC-28H had adequate
heatsinking for extended high power operation, many of the other rigs do not.
An alternative is a lower power radio and a brick amplifier. You can find
tons of 10 watt class 2 meter radios on the used market cheap, and a brick
isn't too expensive. That can give you 160 watts.

You've also got to consider environmental factors. If temperature
extremes and rough off-road driving are factors, you need a radio

that will hold up under those conditions. Yaesu has some "milspec" radios that might meet the need. They're a bit larger than the current crop of tiny radios, but still small enough to be practical for mounting in a truck.

Also, don't forget a high performance, and rugged, antenna. Antenna gain works both ways, transmit and receive, so it is more valuable than just a high output radio. A NMO mounted Larsen 5/8ths wave antenna may be just the thing to put on top of the truck. If you travel into the outback regularly, a collapsable yagi and a push up pole might ride in the truck for those times when a bit more gain and height would make the difference (obviously for use when you're stopped). Good coax is a must, don't throw away your power in cheap coax.

For the base rig, your choices are quite a bit more limited. For a 2 meter only multimode, the IC-275H is the unquestioned champ. But for satellite, the tried and true FT-736R 2m/70cm *duplex* radio remains the favorite of satellite operators. Beware of the Kenwood TS-790A, it has problems for satellite use, and a bad thermal design and poor user interface to boot. The IC-820H is a bit quirky for satellite use, and the IC-970 is too expensive for your budget.

An option for the soon to be General is the new IC-706. It is both HF and 2 meters. That still leaves you looking for 70 cm equipment for satellite operation, however. And while the radio is nice (very nice), it isn't completely top of the line in terms of raw receiver performance. If you're thinking of HF mobile, however, and need a radio to do dual duty, it is a very attractive and cost effective option. It is 100 watts on HF and 6 meters, and 10 watts on 2 meters. So use of a brick to bring the 2 meter side up to 160 watts would make a potent mobile or base combination for HF through 2 meters all mode. (If I could have only one radio, I think this would be it.)

HF only radios and transverters are an option, but beware, there are several potential gotchas here. First, the number of suitable transverters is limited, and the number of HF rigs that work well with transverters is limited too. The SSB Electronics transverters are about the only commercial choice. They're very good, but also expensive. Second, you need to listen at the same time that you transmit for satellite operation, and that means two transverters and *two HF radios* because most (if not all) HF radios won't operate full duplex. Of course, one of the HF rigs can be only a receiver, but it needs to be a good one, and there are few of those on the market today.

You could pair a two meter all mode with a HF rig and 70cm transverter. That would work all right for satellite, but now you have 3 boxes to deal with, and a fair hunk of change invested. Or you could use a 70cm all mode, like the excellent

IC-475H, and a 2 meter all mode like the IC-275H (makes a *wonderful* Mode B station), but now you don't have HF, and the pair costs quite a bit more than a FT-736R.

The 2 meter rig *could* be the IC-706, however, paired with an IC-475H for 70cm, and then you'd have HF too. That's an interesting combination.

Again, I'd advise that there are tons of used rigs out there. You *can* find excellent buys on used HF equipment, such as the fine IC-735, and many many choices for FM VHF/UHF rigs. Where things get a bit tight are in the multimode VHF/UHF market and the transverter market. There have been many fewer of those sold, and some aren't very good, so you might have a hard time finding what you need on the used market.

And finally, you can *build*. That's not as popular as it once was, but thanks to high integration parts, and some excellent designs, you can build credible equipment for VHF/UHF FM or SSB, and even for HF. VHF FM rigs are almost trivial to build today, and thanks to Rick Campbell (and the new DDS chips), single band SSB rigs up through 70cm are also a snap. A multiband HF rig could be daunting, however, due to all the required filters and switching.

The real drawback to building is packaging. Making something homebrew look nice and be easy to operate is still not trivial. However, microprocessors can take much of the pain out of the user interface, and Ten-Tec sells some nice cabinets. This probably isn't the right approach for a new ham though. You do need some skills besides being able to solder to successfully build a quality rig from scratch.

You can basically forget kits, most of them offer less performance, and higher cost, than commercially built equipment (especially if bought used) and teach you little other than how to follow directions and solder. Some kits can be used as *subassemblies* however, such as the Kanga kits of Campbell's designs, the Down East Microwave kits, and some of Ten-Tec's kit offerings such as their 6 meter transverter (you can't buy a 6 meter transverter for what Ten-Tec gets for their kit). FAR Circuits also performs a real service by offering boards for popular circuits at low cost. This takes a lot of the pain out of building, though if you use SMD parts, making your own boards isn't hard. Accurately registering all those through holes is what makes PC board fabrication difficult for the home builder.

Hi Al,

The A B C D buttons are used in the same way that the 1-9 keys are.
They add 4 additional DTMF keys for controlling repeaters or making
autopatches. Our repeater group uses them for some DTMF codes.

That's It !!!

Have fun with your radio..

73's

Kevin

BEWARE OF DELAING WITH DERRICK HALL OF SEATTLE, WASHINGTON!

On November 17, 1995 I sent him a money order (as he and I agreed) for a PK232. He claims to have sent the package but that it was returned. I assured him that the address in my letter that accompanied the money order was correct (a mail center) and to resend the package. As you dear reader, have guessed by now, no package.

I have called Mr. Hall on 12/1, 12/11, 12/12, 12/13, 12/17, 12/18, 12/19,12/20/95, 1/2/96, 1/15, 1/22, asking for either PK232 or return the money! No money, no PK232.

He sent me this message:

*** Forwarding note from DERRICK --PB1 01/22/96 16:05 ***
"To: jcscott@PacBell.COM

Subject: NOTE 01/22/96 16:05:00
I Got your message, that you call this morning. I sent your Money order in the mail on friday, I think it was after 5:00 when the mail stops up here so it should have went out on saturday. It does not matter if you try finding my employer be cause I am the employer so if you wanted to say someting you could call me up. Why do you think i be gone so much. Well anyways your money should be comming with in a few days. And don't call me back!!!!!!!"

I attempted to respond with:

"Subject: NOTE 01/22/96 16:05:00
Derrick
I have called and paged you numerous times with no return call. Specifically I called and left messages on 12/11, 12/12, 12/13, 12/17, 12/18, 12/20, 1/2/96, 1/15, and 1/22.

I originally mailed you the money order on 11/17/95 so you can see why I upset about "no communication" from you, no PK232, and no returned funds.

When the money shows up I will cease to call and bother you.

NOTE 01/22/96 16:05:00" F

My response to hime was rejected. The postmaster on his system responded with:

" Subject: Identify User
Your email to Derrick Hall is being rejected because he has run out of credits. When he purchases time, he will be able to receive email again."

I called Mr. Hall again on 2/6 and 2/15, same results, no money, no PK232. On 2/15 I offered to mention his business practices on the net and this note is the result.

If any body in Seattle reads this and employees this man (I think he is an independent contractor) be sure you are getting good value for your time and money. He is not very honest in his dealings on the Internet.

BUT, if you REALLY want to "triumph", add technology TO skill, and
REALLY wail! Amplifiers in amateur radio are what Corvettes are to
automobiles - not for everyone, but a real BLAST when called upon to
perform. You won't need one every day, but when the going gets tough and
you really do want to be heard, it's sure nice to reach over and hit that
nitrous, er, "on" switch...

Of course the IC-706 does have a separate antenna connector for
2 meters. It doesn't do simultaneous receive on 2 bands or operate
full duplex though. That's admittedly a drawback compared to separate
rigs.

Well, in addition to the transmitter itself, you need some sort of
I/O device. That could be a Morse key, a microphone, or some sort
of data modem. And, of course, if you want to receive too, you need
a receiver. An antenna is required as well. But most important is
the knowledge needed to make it all work properly and legally. A
start on that knowledge could be obtained by the studying you do
to get the (required) license.

That implies you are losing nearly 70% of your power. At QRO, you will
need to force-air cool your ATU to keep shifting 1kW of heat out of it or
see a rapid melt down.

Hi Chris,

The FCC very specifically prohibits the inclusion of any simple device or system that allows the radio to volate the conditions of type acceptance. It's very plainly written that any device that includes such a system is in violation of type acceptance, and the manufacturer can loose type acceptance, be fined, and be forced to recall or correct devices that have been sold.

So here's my point, if *REAL* Hams enjoy ten meters on amps, enjoy buying a six meter amp, enjoy modifying a radio for MARS or CAP, or use the radio for legimate work applications they should refrain from posting illegal (yes the mods are ALL illegal) mods on internet.

If too many devices wind up creating a problem, either by CB'ers using them outside the CB band or some idiot using the radio on an emergency channel, the FCC will start to look at everything a little closer. I can say this much from direct experience, if the person reviewing the FCC file suspects the devices will be used outside type-acceptance, the device won't get approvial. It will fail testing over and over again.

We should think what may eventually happen before we "wink wink" or "nudge nudge" ourselves into an unwanted restrictive situation with cute, coy or fully open public descriptions of how to violate type acceptance on the net. Let's not make any legitimate manufacturer trying to make things easy for HAMs suffer because of these internet postings.

The mods are illegal, because even the ability of the equipment to be modified is illegal! And that's true even for a licensed amateur.

It's just intentionally "overlooked" when the use is legit. Let's not spoil that.

Correction : I would bet Icom would NOT do Warranty service on a Radio
(i.e.:IC-706) that way modified to transmit DC-light!

Date: 18 Feb 96 17:06:40 GMT
From: aust@gandalf.sp.TRw.COM (Mike Aust)
Subject: ICOM IC 706 AIRBAND-Transmitter 10 Watt

I would bet Icom would NOT do Warranty service on a Radio
(i.e.:IC-706) that way modified to transmit DC-light, and
probably would not honor the service warranty.
They might even restore it to stock condition, and charge
you for doing that service!!
In California, a couple of hams had their HT's taken away
by the Sherrif Department for transmitting for help on their
frequencies.
You do the mod, break the law, be prepared to pay the price,
via the manufacturer when needing a repair or thru violation of
using a non-type acceptance radio on a service.
I am a reserve, with a serice that does law enforcement,
I listen to them on my ham HT, but I use my commerical Bendix
King HT when talking with them, with callsigns assigned by
them.

We all remember this quite well. Local jurisdictions don't always care
about or even understand Federal law. That would not stop, for an
instant, from using whatever means necessary to get help in a bona fide
emergency. Anyway, as I recall, the county supervisors
instructed the sheriff to give the radios back, someone
correct me if I'm wrong.

> You do the mod, break the law, be prepared to pay the price,
>via the manufacturer when needing a repair or thru violation of

Doing the mod does not automatically imply breaking the law.
Even using a modified radio in an emergency does not imply
breaking the law, though it often comes down to how elightened
your local law enforcement agencies are.

> I am a reserve, with a serice that does law enforcement,
>I listen to them on my ham HT, but I use my commerical Bendix
>King HT when talking with them, with callsigns assigned by
>them.

As well you should. That has nothing to do with using whatever
means necessary to get help in a bona fide emergency.

I am looking for a good used tower between 40' and 60' with all
necessary mounting hardware. Will consider complete units
(tower,rotor,mast, ect.). Must be in northern Utah area. Will pick up.
Must be reasonable in price. NO junk!! E-mail if you have one.

Paul

2442. For Sale: General Electric Manuals

Newsgroup: rec.radio.amateur.equipment

>acceptance, be fined, and be forced to recall or correct devices that have
>been sold.

So, what about radios that aren't type accepted, like amateur equipment
other than external power amplifiers used below 144Mhz? In fact, amateur
equipment used below 30MHz doesn't even require Part 15 notification.

>So here's my point, if *REAL* Hams enjoy ten meters on amps, enjoy buying
>a six meter amp, enjoy modifying a radio for MARS or CAP, or use the radio
>for legimate work applications they should refrain from posting illegal
>(yes the mods are ALL illegal) mods on internet.

No, not all mods are illegal. Please cite specific laws stating so.
Yes, it generally is illegal to use a radio in a service for which
it is not approved, but it is not illegal to simply modify a radio.

>If too many devices wind up creating a problem, either by CB'ers using
>them outside the CB band or some idiot using the radio on an emergency
>channel, the FCC will start to look at everything a little closer. I can
>say this much from direct experience, if the person reviewing the FCC file
>suspects the devices will be used outside type-acceptance, the device
>won't get approvial. It will fail testing over and over again.

Which won't stop a single amateur transceiver from being sold under
the current law, since none of them are required to meet type acceptance
rules. Amateur receivers over 30MHz must be tested for part 15
compliance and the FCC notified, but this has nothing to do with
transmtting on emergency channels - it is the receiver.

>We should think what may eventually happen before we "wink wink" or "nudge
>nudge" ourselves into an unwanted restrictive situation with cute, coy or
>fully open public descriptions of how to violate type acceptance on the
>net. Let's not make any legitimate manufacturer trying to make things easy
>for HAMs suffer because of these internet postings.

Not bad advice, but not really meaningful when anyone can buy several
different books describing mods, with pictures in some cases.

>The mods are illegal, because even the ability of the equipment to be
>modified is illegal! And that's true even for a licensed amateur.

This is simply not true. There is no type acceptance for amateur equipment other than HF/6m external power amplifiers. It is not illegal for an amateur to modify a power amplifier for 10m and 6m operation, as specifically spelled out in Part 97.315. There is Part 15 notification required for amateur receivers operating over 30MHz, but this is only for receivers and is not type acceptance.

>It's just intentionally "overlooked" when the use is legit. Let's not
>spoil that.

That's simply not the case. As mentioned above, there is no type acceptance of amateur radios to be violated by modifying the radio. There *are* type acceptance requirements for other radio services (most notably Part 90 (Land Mobile Radio Service) and Part 95 (CB and GMRS)) that prohibit the use of modified amateur radios, but that only applied when those radios are used in those services. If you've got a modified radio as the IF in your 2.4GHz transverter lash-up, you're not breaking any law.

Funny thing, that antenna jack. Mine works for shortwave, albeit not as good
as attaching to the whip. In fact, according to the manual, it's *supposed*
to work for shortwave, and *only* shortwave. But I've found that mine works
for mediumwave and longwave too, if you don't mind a little overloading (to
the point of unusability on longwave).

For immedeate sale:

- Icom W21AT Dual band handheld with 50-999MHz recieve
- Two BP-157 battery pack with built-in whisper mike for full duplex
- Wall charger
- Manuals and schematics

I used this radio only for Rx at home (nice for it's wide coverage), but I just got a new base scanner that does the same job with more 'scanning' features (more memories, but no cell...). I need to sell this radio to pay off the scanner bill that will be coming in the mail any day now. Everything is in like-new condition, no scratches or markings of any kind. I'd like $400 for the lot, but the best offer will get it. Also, to fastest offer will get it!

Thanks,

Dave

The Raymond Sarrio Company's Ham Radio WWW site is proud to announce a FREE Ham Radio classified advertising page at http://www.csz.com/sarrio.html. This new classified page will allow Hams to find equipement with the help of a search engine--no need to scroll through 100's of listing before you find that special piece of gear. Plus, when you find the gear you'er interested in, you are also provided with easy point-and-click e-mail access, directly to the Ham that listed the item.

For those Hams with gear to sell, take note! there is NO charge to list your equipment within Ham Classifieds, and there will be no posting time delays. Your posting(s) will go on-line, in our classified search engine, in about 1 hour. All you need do is fill out a simple forms page, and upon its (point-and-click) submission your "For Sale" classified is immediately on-line.

```
I will be purging the classified listings initially, about once every
month, but that timeline will shorten as our classified numbers grow.
```

Hello;

I've got a friend who has an old Grudig/Telefunkin Radio. He is looking to use the radio but has run into a problem: He can't seem to identify the auxilary input and output connectors on the radio.

The model number of the radio is KS-712U. Does anyone have any ideas about what these connectors might be? How about the North American number for the Grudig parts distributor?

Thanks... 73es

An old HP Application Note that I have dated 1960 says that the 803A bridge is used "for measurements of 500 mc or below."

I remember using one in EE lab in the late 60's. We drove it with a HP-608 RF generator and used the matching HP 417A VHF (super-regen) receiver. You should be able to use any receiver with it, or a spectrum analyzer. The receiver is, after all, just a null detector. As I recall, we were using it around 300 MHz. (The 608 had a maximum frequency of 480 MHz or less, depending upon the particular model; some topped out at 420 MHz.)

If you have a pure (that is low harmonic and spurious) generator capable of AM or pulse modulation, you can use a broadband crystal detector, followed by a narrow-band tuned amp/meter, like an HP-415B (to keep things in the same 1960's vintage). (Modulate the generator at 1000 Hz or whatever frequency for which your tuned amp/meter is set.)

I wouldn't mind owning an 803B; as I recall it was pretty easy to use. (Beat the slotted line and Smith chart).

Service manuals are available for all three of the Radio Shack amateur radios. Drop by your local Radio Shack and ask them about ordering the service manual for your particular radio. The manuals vary in price. They offer complete part break-downs as well as other useful info such as alignment procedures etc.

The manuals are available on a pay in advance basis and are shipped directly to an address you specify.

Thought you might like to know. Rob, KE6NVW / 7K6CDQ

Message-ID: <3127750D.6C22@racalrecord.com>
Source record: 205544

I have recently acquired 2 R390Aï¿½s and I am in the process of restoring them. I am looking for a source of parts, Fair Radio is the only one I am aware of are there others?

One of the R390ï¿½s was to be used as spares for the first one but I am going to make it operational instead. I am looking for the cover for the Mechanical Filters and a cover for Z503. This one , a Collins from a 1951 contract, does not appear to have had an oven that fit over the top of the crystal tray. Is this the case?

Besides Fair is there a better source for tubes for these?

Does anyone have any hints for refinishing the knobs?

It has been 15 years since I worked on R390ï¿½s but at that time we had 750 at the AF site I was stationed at.

Thanks

Hello,

We are having great difficulty finding a source containing the mods
for various Motorola radios to make them 9600 baud packet capable, if
possible, otherwise 1200 baud.. I am sure the problem is that I am searching
in the wrong spots.

We have access to some Radius, Maxtrac, Micor, (Motrac vhf base), Mitrek
mobile units.. There are some UHF and some VHF units and all are ready
for hamband operation. We are trying to build a backbone network for the
statewide VA Digital Emergency Network (VDEN). All of the units are working
but we need to interface the tnc's to them correctly. Does anyone know
where I can find these Motorola mods or a good source of such information??

I can supply model numbers if needed. The older Motrac vhf pager base is
model B93MPY-1100BT-SP11 with a CC3064 xmitter and may be too old for
anything other than 1200 baud.

Any thoughts, suggestions will be appreciated!

Regards,

Ben Sager

I purchased one just last week. Great rig! The receiver is as sensitive
as my Ten-Tec Scout on all of the bands.

The rig is being used as a base station and replaces a Ten-Tec Scout.

I've worked DX SSB into Southern Africa and Europe and CW with great
reports on the quality of the signal. Has all of the features expected
in a modern HF transciever, except a builtin keyer.

I've done some SWL'ing and have been impressed with the performance using
an 80m dipole. I live on top of a small hill so there is potential for
much IMD especially from the other local hams on my street, an AM
broadcast tower only about 1 mile away and an airport only 4 miles away.

On 6 meters FM, I've been getting reports of a hum on my signal. This may
be due to the PL deviation. Alinco will repair it free of charge under
warranty if I send it in.

For the wish list there are only three things I would add to thi

One way to avoid these types of deals is to have the possesor of the
equipment send it COD. At least you get a package (no telling what's
in it) and the sender doesn't get any money until the package arrives.

I have purchased several things this way and, fortunately, have
gotten what I paid for. There is really no way to judge the character
of individuals who sell through the postal service.

-I have two C5718DAs - one in my car, one at home. They're excellent,
-full-featured rigs with very good intermod rejection. They are among
-the more expensive 2m/440 mobiles around, but if you can afford
-them, they're excellent.

I'd suggest you try one out before you buy it. We had one in our club shack for a few days (returned it for an Icom), and I could never get the hang of that mike... I tried to change the volume in the middle of a net and found myself off on some other memory channel (it uses the up and down arrow keys for channel, volume, squelch, and some other functions). This is purely a personal choice; I know some people who love the radio, and I had no problems from a technical perspective, just ergonomic. I guess the Yaesu spud-mike radio may have similar problems, but at least it looks like volume and squelch are knobs, like they should be :-)

2479. ICOM IC 706 AIRBAND-Transmitter 10 Watt

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-18 00:00:00 UTC
From: aust@gandalf.sp.TRw.COM
Message-ID: <9602181706.AA18096@noldor>
Source record: 205557

I would bet Icom would do Warranty service on a Radio
(i.e.:IC-706) that way modified to transmit DC-light, and
probably would not honor the service warranty.
They might even restore it to stock condition, and charge
you for doing that service!!
In California, a couple of hams had their HT's taken away
by the Sherrif Department for transmitting for help on their
frequencies.
You do the mod, break the law, be prepared to pay the price,
via the manufacturer when needing a repair or thru violation of
using a non-type acceptance radio on a service.
I am a reserve, with a serice that does law enforcement,
I listen to them on my ham HT, but I use my commerical Bendix
King HT when talking with them, with callsigns assigned by
them.

>Actually it's bad form to post ANY mod that violates TA of the product,
>like out of band HF mods.

Since amateur transceivers in the US are not type accepted, there's
no mod that violates the (non-existant) TA. Out of band HF mods
are useful for MARS operation, and may be useful for emergency
use.

It is also true that a modified amateur transmitter may become
capable of operation in a service for which it is not type accepted;
it is worth pointing out that this is not legal, though commonplace
on VHF and UHF.

Out-of-band mods are quite useful when using a transceiver as part
of a transverter lash-up.

>Half the people that want those mods are the SSB CB idiots that operate
>outside the band and use amateur equipment. Not only does it encourage CB
>use of Ham gear, if the FCC ever got a complaint the manufacturer could be
>in big trouble.

Under which code can a manufacturer be held liable for the action
of someone that does not represent the company?

I have an RF-B65, and like it a lot. Its BFO is quite stable for a portable receiver (desirable for SSB/CW, critical for fax and sitor), and it can be had used for $100 or so (I got mine for $85). It only offers 9 memories per band (LF, MW, FM, SW), and it lacks synchronous AM detection, but for the money it's a fine receiver. Best of luck.

Hi Tom;

An easy way is to use an RF ammeter and a resistive dummy load. Tune your transmitter into the load directly and set it for highest reading on the ammeter. P=I*I*R.

Now go thru your coupler and tune again for maximum ammeter reading. Again P=I*I*R. P1-P2=lOSS.

We are assuming that your best power output occurs at approximately the same power input level, in both cases. Generally this is valid, but you can also verify the input level independently. It is important that you make the measurements with a resistive load.

DO NOT BE SURPRISED IF YOU FIND LOSSES IN THE ORDER OF 15-30%.

Happy DXing 73-K9JDU

There are two things you can do...

1. Do NOT use AFSK. Use the FSK connections...
2. Kenwood has a technical sheet on this. You may call their BBS and get the scoop. Perhaps someone knows that number

I ran a TS-850 and a KAM for a while. I also used the FSK port for all my HF digital activity. I never had a problem.

Good Luck,

Feroz, 4S7FG/WU9N

I use the 870. Like it lots

1. The DSP is great
2. Good RX. Except if another HF station is transmitting next door.
3. Lots of flexibility in settings
4. 12V
5. No external interface is needed to connect to the computer & can comm at speeds up to 57.6K
6. The control package is fun
7. IMHO lots of radio for the money.
8. If you wish I can e-mail you (if I find it) a compilation of contestors who used this radio under gruelling contest condx. My conclusion is the results are mixed with more in favor of the radio. Let me know...
9. No external filters are required
10. Excellent built in K1-Logic-keyer

naa...na...na...na na...

Let me know if you wish to discuss more...

Hello dear hams.

I have a big problem since I bought a Kantronics All Mode.
When the HF port of my KAM is connected to ACC2 of my Kenwood TS-850 I try to talk on HF on USB or LSB mode with the transceiver and my output voice is not clear !!! I must disconnect the KAM from the TS-850 and the output voice is clear...

Do you know any modifications for KAM or TS-850 to clear this problem ??

Many thanks, hope have info.

Anthony R. Gold (tgold@microvst.demon.co.uk) wrote:
: I have been offered an HP 8660B (Keyboard Mainframe Sig Gen), including
: the appropriate Mod and RF Sections, but the unit is a mystery to me. It
: looks just like the 8660C but I can't find this B model in any of the H-P
: T&M catalogs I have access to. I can only see A's C' and D's through 1989.

I've just had a walk to our library, and have had a look at the
catalogues from 1975 to-date. No mention of an 8660B at all. The D
appaers about 1988 and disappears about 1991. The D replaced the A
(thumbwheel switch tuned) and the C.

What age is it ... check serial prefix, you'll see something like
2315A..... The first two digits are year since 1960, the next two are
week number. A means built in the US, U for UK, G for Germany.

The 8660 was in production for an amazing time, extended well beyond
when better things had overtaken it because it was designed into a
variety of automatic systems and demand kept up because of the reluctance
of people to redesign their systems.

They are heavy, very very heavy. They were good in their day but their
phase noise and reliability are not to modern levels. Many had a huge fan
upgrade kit fitted externally to try to help MTBF when used in full
racks. Lots of antique TTL families like 74H stuff in the synth loop
dividers. Those dot type display leds have built in latch-decoder ICs and
take almost an amp each digit (You had to heatsink displays in those
days).

What do you want one for? Is your bench up to it? If you want to
stack a few of them, consult Stephen Hawking, he'd love to watch....

If you need a synth, and it's cheap enough to make periodic
intervention tolerable, they offer some hard to equal modulation
capabilities if you can find the right plug-ins.

Not much help, Sorry
David GM4ZNX

: Has anyone heard of this instrument and can tell me any and all
: differences bewteen the B and C models? I heard that one must throw an
: internal switch to tell that mainframe of a change in RF Section tuning
: range, while it is automatic in the 8660C, but that is about all I know.

Hi Dana,
In article <4g8cb2$br7@abyss.West.Sun.COM>, myers@West.Sun.COM (Dana Myers) writes:
>So, what about radios that aren't type accepted, like amateur equipment
>other than external power amplifiers used below 144Mhz? In fact, amateur
>equipment used below 30MHz doesn't even require Part 15 notification.

Not much will happen unless the FCC decides the equipment was manufactured with an intent to be used on the CB band. Then part 95 kicks right in. So if ICOM sells a rig that easily converts to CB operation, and enough of them turn up in the hands of CB'ers, the FCC can consider that an intent to market a CB transceiver. If the rig fails the provisions of part 95, they're in hot water.

>No, not all mods are illegal. Please cite specific laws stating so.
>Yes, it generally is illegal to use a radio in a service for which
>it is not approved, but it is not illegal to simply modify a radio.

That's right, not all mods are illegal. Sometimes only the use is. If the mod causes the equipment to violate the rules that allowed it to be manufactured, the mod is illegal.

>Which won't stop a single amateur transceiver from being sold under
>the current law, since none of them are required to meet type acceptance
>rules. Amateur receivers over 30MHz must be tested for part 15
>compliance and the FCC notified, but this has nothing to do with
>transmtting on emergency channels - it is the receiver.

If there is cause to believe the manufacturer "intended" to provide equipment that operates on the CB band, the gear must pass part 95. You can bet the FCC will yank the equipment, or at least give the manufacturer grief when he needs something else approved. The equipment may not be required to be type accepted or type approved, but there are still standards.

Even a general coverage receiver that operates on the CB band might be required to pass part 15 certification.

>>The mods are illegal, because even the ability of the equipment to be
>>modified is illegal! And that's true even for a licensed amateur.
>
>This is simply not true. There is no type acceptance for amateur
>equipment other than HF/6m external power amplifiers. It is not
>illegal for an amateur to modify a power amplifier for 10m and 6m
>operation, as specifically spelled out in Part 97.315.

The section you refer to indicates it is ok for an amateur to modify non-type accepted equipment for use on amateur bands, not the other way around.

Try Section 97.317. 97.317c(3) specifically prohibits even **instructions** that will allow equipment (in this case amplifiers) to be operated outside the rules. Kits that allow operationoutside the rules are illegal, instructions for conversions are illegal. The fact the user is a Ham makes no difference.

The very fact equipment under 97.317 can be "converted to unauthorized use" makes the equipment illegal! Manufacturers made a "general agreement" with the FCC years ago. The agreement was manufacturers would take all steps possible to prevent amateur equipment from being used by CB'ers, in lieu of tougher rules and enforcement. The FCC informally agreed to "overlook" help with ten meter mods if the manufacturers screened for a license, with the understanding if Ham equipment continued to be a headache things would get rough. If the FCC wanted to enforce the rules on the books now, ten meter conversions would be a thing of the past. Hams not only wouldn't get instructions, they wouldn't get parts. Plus the equipment would be made much more difficult to modify.

>>It's just intentionally "overlooked" when the use is legit. Let's not
>>spoil that.
>
>That's simply not the case. As mentioned above, there is no type
>acceptance of amateur radios to be violated by modifying the radio.
>There *are* type acceptance requirements for other radio services
>(most notably Part 90 (Land Mobile Radio Service) and Part 95 (CB and
>GMRS)) that prohibit the use of modified amateur radio

Source record: 205496

Hi folks!

I'm thinking about a new, fancy black box rig to replace my TS530SP, and I've been pondering a TS870. However, I can get a secondhand TS950SDX for less than the TS870, and that's not even taking into account the extra cost of the powersupply.

My question is - is there any reason why I should get the 950 instead of the 870? I know there are a few features on the 950 that aren't on the 870, like an extra 50W output (only adds 1.7dB, though) and dual receivers. Has anyone experience of either to be able to say 'Yes, go for that one!'?

Every radio station has three parts: a transmitter, a receiver, and an antenna. The transmitter generates alternating current at radio frequencies (RF), and modulates it with information: usually sound, video, or data. The transmitting antenna radiates the energy into space as electromagnetic waves, and the receiving antenna collects a small part of that energy and sends it to the receiver, which filters, detects, and amplifies it.

Radio frequencies below about 3 MHz usually don't travel very far, especially during daylight hours. Frequencies between about 3 and 30 MHz bounce off the ionosphere (a charged layer of the atmosphere about 50 miles up), and can travel around the world, even with very low power transmitters. Frequencies much above 30 MHz punch through the ionosphere, and so don't usually travel very far on the earth's surface; they are used mostly for local communications.

Ham radio is a hobby that allows you to operate your own transmitter and talk to other hams locally and world wide (there's about 2 million of them, so there's always someone to talk to :-). It also gives you the opportunity to serve your community by providing emergency communications during times of crisis; hams are frequently the only means of contact when a natural disaster isolates an area.

You must earn a license to operate a ham station by passing a test in radio theory and electronics, regulations, and operating procedures. There are five classes of license: Novice, Technician, General, Advanced, and Amateur Extra. Each class grants more priviledges, and is more difficult. All require reception of morse code except one varient of the Technician class. With your license, you'll be assigned a callsign; mine's N4PDY. Most folks start with the no-code Technician license, which gets you priviledges that allow local contacts.

Hams operate locally on VHF (Very High Frequency). Most hams have radio sets in their cars, and talk to local friends over a 50 mile area. This is mostly through repeater stations operated by radio clubs. Repeaters pick up the signal from the mobile set in your car and rebroadcast it at high power from a very tall antenna. There are repeater stations all over the country; every city has a dozen or more, and even rural areas are pretty well covered. Almost all these repeaters are open for any ham to use. Most hams also have small hand-held pocket VHF or UHF radios called

Handi-Talkies (or HTs). These are very nifty; I have three of them :-)

Many of these repeaters can also link your signal to the telephone line; it's called an autopatch. You can make outgoing calls, but not receive incomming calls. Calls must be quite short in duration, and only personal calls are allowed; no business calls of any kind. In most cases, you must be a member of the club that runs the repeater to use the autopatch. Club dues tend to run around $20 a year.

Hams talk world wide on HF (High Frequencies), also called shortwave. With a modest station and an outside wire antenna you can talk to other hams around the world. Most of this is done on voice, but many old-timers (like me) still enjoy using morse code. Digital modes are also available, where you converse by typing messages on your computer keyboard. A device called a "terminal node controller" couples your computer to your radio; it's a bit like a modem.

Ham equipment is not particularly cheap, but it need not be overly expensive, either. A VHF mobile set for your car runs around $300, and a good HT can be had for $250 or so. HF sets are a bit more; they start at around $900; a very good one is $2,000, and top of the line is $4,000. These are prices for new sets; there is a lively market in used gear, and you can get a good used set for around half the price of new.

There is a national organization of hams called the American Radio Relay League (ARRL). They will provide you with tons of free literature on becomming a ham, and will also put you in touch with a ham club in your area that will help you earn your license, and get the gear you need (some clubs even have loaner rigs to get new hams started). Call the ARRL at 203-666-1541 and tell them you want information about becomming a ham; they'll fix you right up. Best of luck.

Mike, N4PDY

Is it possible to operate Pactor on a TS-940 in the real FSK mode?
I had assumed that you had to use AFSK.

Source record: 205501

In article <4g7vu2$333@newsbf02.news.aol.com> w8jitom@aol.com (W8JI Tom) writes:
>The FCC very specifically prohibits the inclusion of any simple device or
>system that allows the radio to volate the conditions of type acceptance.
>It's very plainly written that any device that includes such a system is
>in violation of type acceptance, and the manufacturer can loose type
>acceptance, be fined, and be forced to recall or correct devices that have
>been sold.

That doesn't apply to any amateur gear except HF external amplifiers
because *no other amateur gear requires Type Acceptance*. Receivers
operating over 30 MHz require Part 15 Type Certification, which is a
very different thing, but no amateur *transmitter* requires Type
Acceptance. None, nada, zip. You could market a 1 kW 10 meter AM
transmitter if you wanted, and not need FCC approval at all. The
FCC only requires Type Acceptance for *external* power amplifiers,
not for whole amateur transmitters. The fact that such a transmitter
could easily be retuned to CB doesn't even enter into the equation.

>So here's my point, if *REAL* Hams enjoy ten meters on amps, enjoy buying
>a six meter amp, enjoy modifying a radio for MARS or CAP, or use the radio
>for legimate work applications they should refrain from posting illegal
>(yes the mods are ALL illegal) mods on internet.

The mods are *not* illegal. *Use* of the radio in a service that does
require Type Accepted equipment *is* illegal, but the actual mod is
not illegal. There are other services besides amateur that don't require
Type Accepted equipment, and of course the equipment could be used to drive
a transverter. So there are perfectly valid reasons to perform such mods,
and it is perfectly legal to do so. In fact an amateur may do that to a
Type Accepted radio, such as a Motorola Micor or GE Mastr II. It's not
even illegal then, though the radio can no longer be *used* in a service
requiring Type Acceptance.

>If too many devices wind up creating a problem, either by CB'ers using
>them outside the CB band or some idiot using the radio on an emergency
>channel, the FCC will start to look at everything a little closer. I can
>say this much from direct experience, if the person reviewing the FCC file
>suspects the devices will be used outside type-acceptance, the device
>won't get approvial. It will fail testing over and over again.

But since amateur gear (other than external power amplifiers below 144 MHz)
does *not* require Type Acceptance, this point is moot. You no longer
even have to use the FCC lab for Part 15 certifications (which receivers
capable of operation over 30 MHz require). That can be done by an outside
lab. So even that can't be used to hold up an amateur product by falsely
claiming the equipment doesn't meet Part 15. And besides, any government

employee who would falsify such a document could be subject to criminal penalties for perjury. An Executive Branch employee would be crazy to try something like that today. A call to a friendly Republican Congressman would have a special prosecutor on the job in nothing flat.

What *could* happen is that the FCC *could* propose a rulemaking to require *all* amateur equipment to be Type Accepted. That did happen with HF external amplifiers. But that *has not* happened yet for any other amateur equipment, so mods are not illegal. Saying that they are illegal based on claims about Type Acceptance is simply wrong.

You might have had a point if you had said that some mods are *unwise* because of the potential for abuse, and the *possible* FCC reaction if such abuse got out of hand, but you've lost any credibility you might have had for such an argument by inappropriately raising the Type Acceptance bogeyman where it does not apply.

Lets reiterate what actual regulations apply.

1) *External* power amplifiers operated below 144 MHz require Type Acceptance. That's the *only* amateur equipment that requires Type Acceptance. Period.

2) *Receivers* capable of operating above 30 MHz require Part 15 *Certification* (which isn't at all like Type Acceptance, and can be done by an outside lab).

3) *Scanning* receivers must not be able to be easily modified to receive cellular phone frequencies (ECPA).

4) Any equipment containing a computer (most any amateur radio made in the last decade) must meet Class B *Notification* requirements. Under recently changed rules, a manufacturer may self-certify to meet this requirement.

5) Amateurs are permitted to modify or build from scratch any radio equipment that they desire as long as its emissions comply with Part 97 spectral purity limits and good engineering practice. Even 10 meter amplifiers can be built, or created by modifying a Type Accepted external amplifier, as long as no more than one of the type is made/modified by the amateur per year.

The only real lever the FCC has is the letter of intent that they circulated to radio *importers*, which threatened to withhold import permits if the radios met certain ill defined criteria. This is not a regulation per se, just a threat. And it has no force in regard to actions taken by US amateurs in any event. In other words, once the radio is in an amateur's hands, he can do whatever he wants to it, including ripping out half its guts and rebuilding it to suit his purposes, or just clipping one wire or removing a diode. That is *not* illegal, even if done to a Motorola Micor or GE Mastr II, much less to a non-Type Accepted *amateur* radio.

>The IC-706 does indeed carry FCC Part 15 Type Acceptance.

Careful now, Part 15 devices require Certification, or in some
cases Notification, but not Type Acceptance. It isn't the same thing.
I'm sure you know this since Icom commercial rigs are Type Accepted
for the services for which they are marketed. The rules for these
classifications are different.

> 73's WD9AHF - JimWell, the wattmeter will have to work at the output impedance of the
tuner.......
Did anyone read the series of articles last year on tuner losses? Some of the comments posted here are contrary to the findings of the author. One that comes to mind is that the loss is independent of the impedance being matched. The articles usually showed that losses were greater for the same SWR when the impedance of the load was low rather than high. The author, Frank Witt AI1H, used the fact that the SWR measured at the input of a tuner with loss will not correctly report the mismatch at it's output. The losses are proportional to the error in the reported SWR. For example, he adjusts a tuner to 1:1 for a 100 ohm load. Then he replaces the load with a 50 ohm load, and then a 200 ohm load. The deviation of the SWR from 2:1 in both cases is due to the loss in the tuner. Read the articles April,May 1995. What do you guys think?

I believe that 97.315(b)(3)(ii) specifically allows the modification of
"an amplifier", not excluding a type accepted amplifier, by a licensee
for use at the licensee's station.

> Type Acceptance. That's the *only* amateur equipment that
> requires Type Acceptance. Period.

To be consistent, perhaps it should be said that external amplifiers which
are not operated are no less subject to Type Acceptance. The test is only
whether they are capable of use or are capable of easy modification for use.

2526. FT-1000D (not MP) vs TS-930

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-19 00:00:00 UTC
From: Scott Ellington <sellington@ssec.wisc.edu>
Message-ID: <4gaiqr$osf@spool.cs.wisc.edu>
Source record: 205509

After many contests with the venerable TS-930, ARRL CW was my first with the FT-1000D. Here are a few observations.

Configuration:

The FT-1000D has all four CW filters, two 500 Hz and two 250 Hz. My TS-930 has the two 500 Hz filters, and been modified to cascade a third 250 Hz filter with the first two. Measured skirt response of both receivers looks about the same at both bandwidths.

Note that over the years I've made some minor adjustments to the TS-930 to improve its receiver performance, and I keep it very carefully aligned. A poorly aligned TS-930 probably wouldn't perform nearly as well. The FT-1000D is about 3 years old and seems to be in perfect shape, but I haven't done anything to it. Many of my quibbles about the FT-1000D should be easy to fix.

****

The FT-1000 AGC is much better, which considerably reduces the pounding the operator's ears take. However, as with the TS-930, an external preamp is required much of the time to get the weaker signals up to the AGC threshold, so one doesn't have to keep riding the AF gain. (Maybe the return of sunspots will take care of this one.) I find the "Fast" AGC of the FT-1000D to be a little too slow for CW.

The FT-1000D has a bit of wide-band hiss when the AGC opens up, generated in the IF amplifier after the cw filters. A minor annoyance with wide-bandwidth headphones.

The FT-1000 QSK is very slow, and it takes half second or so for the AGC to recover. One really can't hear anything between the dots at 30 wpm or so. The TS-930 fully recovers between dots, so one can even hear backscatter echoes, which is useful for judging propagation. The TS-930 AGC recovers instantly, so even very weak signals are audible between the dots. The TS-930 also has the nice feature that in QSK mode you can step on the foot switch and mute the receiver when you get tired of listening to all the noise. The FT-1000 foot switch closes the key circuit in QSK mode, so that won't work.

The lower phase noise of the FT-1000 makes it possible to hear weak signals a little closer to the very strong ones. I never felt the TS-930 phase noise cost me many contacts. On the other hand, with the 250 bandwidth of the FT-1000, I was able to park right between a couple very strong stations and run Europeans on 20, which I don't remember being able to do with the TS-930. Since the skirt response is about the same, the phase noise may make the biggest difference.

Neither receiver has ever shown any sign of problems with front-end overload. The lab tests show that the FT-1000 is a bit better, but the TS-930 was adequate, even in high-sunspot years when there were often a lot more strong signals.

****

In summary, there's no doubt the FT-1000D receiver is excellent, but the TS-930 really isn't much worse. Aside from the maintenance issue, an old TS-930 still makes an excellent contest rig, and it's certainly cost-effective. I'm going to keep them both.

I have for sale a MFJ Super Hi-Q loop antenna (model 1786). I used it when I was an apartment dweller and now that I bought house, I don't need it. (I put up a GAP Titan DX Vertical)

I works very well, DX and all. It works on 30-10 meters continuous.

It is 36" in diameter, and I have it mounted on a short tripod - ideal for a balcony of and apartment or condo.

It also comes with a semi-automatic indoor tuning unit that you put next to the rig.

I live in the Minneapolis Metro area.

I am asking $175.00 for the antenna and tripod.

Please E-mail if interested.

Source record: 205382

I need help identifying a transceiver. It was built by Zero Manufacturing Co. With addresses in Burbank CA and Monson Mass. It is housed in a 10 by 4 by 6 inch water proof case that appears to be water proof. It was made in early 1965 with a serial number of 2x.

It covers 3 to 8 MHz and has 4 crystal channels with separate transmit and receive xtals. There no name or the name was on a missing labile in the top of the case. It is AM/CW and all solid state. With 500 cps and 6 kc filters.

The built in key that has to be the worst key I have ever felt. It is a lever that presses down on a regular switch. The antenna attaches to binding post and it has loading, bfo, gain, IND sense and battery test controls. There is a switch marked "whisper" out in near the mike jack. All the jacks are 1/8 inch phono-plugs. It also has a switch that is a 1/4 inch rod about 2 inches long between the mike plug and the built in key. The tuning indicator is a light bulb. The heat sinks look like they would handle 4 or 5 watts.

There is a hole in the upper right of the radio that is 4.75 by 1.75 inches and 3.75 inches deep. There is a 4 pin male plug in the bottom with wires going to all pins. This obviously a battery box. The case is painted army green. There is also an air relief plug that I would guess this is to admit air so it could be opened if it had a vacuum in it.

One PC board is marked AX-78830 rev A and another is x7295381 rev F. The boards are coated with some from of clear
coating and the some of the wiring connections are covered with soft adhesive. It appears to be very similar to a 3M product that is used to glue aluminum skins to foam cores in Brantly helicopter blades.

I assume it is some sort of spy rig designed to survive direct burial.

I would appreciate any help on identifying it and finding documentation on it. Particularly the pin out on the battery.

Thanks
Gordon AB5DG

Thanks
Gordon AB5DG

Well guys, I do matching for a living. I generally tune loads from 15
to 2000 ohms and with phase angles from 0 to +- 88 deg.
As a rule of thumb.... the lower the impedance is and the higher the
phase angle the higher the loss. Now... there is one exception for
that. EVERY load can be matched with reasonable low loss (abt 10-15
%) if the tuner is built with high quality components AND the tune
range is small. Generally there is an inverse relationship between
efficiency and tunerange. The larger the tunerange is the lower the
efficiency for a given frequency. The closer the phase angle is to 0
deg the lower the loss is. So it is no problem to tune a 10 ohm 0 deg
load with a wide tune range tuner and get reasonable low loss. But as
soon as the phase angle changes from 0 deg the loss will rise very
fast . We have a auto tuner for 13.56 mhz in our program that tunes
from 10 ohm -89deg to 2000 ohm +60deg and everything in between. The
average loss is around 50% and can go up to 70%;a lot of heat for a
1kW tuner.
We also have tuners that have only 10% loss but a very narrow tune
range. For the average ham tuner I have measured everything from 5-15%
in to "nice" loads to 50% loss into short 160 and 80m verticals.
The best way to find out is to calculate the exact impedance for a
given frequency of interest and build a "load simulator " for this
frequency with capacitors or coils and using a 50 ohm load to take the
power. With this you could then measure the power into the tuner and
also measure the power into the 50 ohm loss. A program like ECA (TM)
could be used to do this.

Gee, guess I missed AD4HL's flame attempt 'till now. No matter. To answer some questions created by his interesting post, I'm very familiar with the toy in question. As a SAR volunteer since 1983, I've used these radios almost daily. They are rather old and quite limited in performance, so they're all but gone from service hereabouts. Personally, I've bought two RH250, one RH252 and two Wilson WU1510 models. The Wilson's worked when I bought them, the Regencys were bought 'busted. I troubleshot and repaired all but one RH250, which requires more parts.

My original reply to AD4HL's post was not intended as a flame, and said so. Nor is this intended as a flame. His post raised what for me were some curious questions. Will the RH250 retune so widely? Perhaps. But his post appeared to say that it would cover roughly 30MHz bandwidth in operation. Wow. The radio was designed to do only 12MHz worth, so I was impressed and curious.

It should be noted that Relm still sells these radios, where the Regency and Wilson units are long gone. But I've never seen a used one go for over $80 in any condition, except the UHF models which seem to do much much better in resale value. I've seen people request as much as $300 for a used RH250, but they ended up taking it home. Most RH250's I've seen for sale had asking prices from $100 to $150. My RH252 was $2 (TWO DOLLARS), one RH250 was $40 and the last was $80 in repair costs, otherwise free. Actually, the RH252 did need another $5 for a speaker.

I operate PACTOR with my TS-940 using the "real" FSK mode.
By the way, if you look at the schematic, you will see that the TS-940
generates "real" FSK using an AFSK generator (jumper selectable shift
170/425/850 Hz.) It does, however, shift the injection frequency so
that the carrier and unwanted passband have increased rejection
compared with putting your AFSK into the microphone or aux input and
operating on LSB.

I have a FT51r and can't seem to figure out how to clear an autodial memory when you want to put a new number in it's place. The manual doesn't seem to explain it...I could do it with the ADMS software and reprogram the HT but I'd like to know if there is a way to do it manually. It seems that if you have an old number in a slot, as you type in a new number, if there are any digits still in place from the old memory they stay there so that your new number will have some garbage digits appended to it. HELP!

Hi again,
I think you are complicating a pretty basic problem. Why not just put a non
reactive load that matches what you think is your feed point impedance and
measure Current and voltage there, and back at the transmitter, again using a
non reactive load do the same. If the two power readings don't match, that's
the loss. Did you ever build an amplifier and tune the inductor for the maximum
efficiency? Maybe I've landed in the middle of a thread that I don't know whats
gone on before, but I can't see what your hung up on. Sorry
Jim

Christophe Marchal's Super Marathon

WE NEED YOUR HELP TO FIND CLASSES WHO WOULD MEET CHRISTOPHE WHEN HE ARRIVES IN YOUR COUNTRY THANKS

An educational project by Jean-Marc Dumont, English teacher at Lycee Gaston Febus High School, Orthez, France.

OBJECTIVES:

-To allow the pupils, through the use of Internet and the amateur radio station F6KGF,run by Gaston Febus' radio club, to follow the sporting exploits of Christophe Marchal, who will take part, in his wheelchair, in the Five Continents Marathon from 25 May to 16 June 1996.
-To bring together pupils and the handicapped
-To sensitize pupils to the possibility of surpassing oneself
-To make use of modern means of telecommunication
-To work with a desktop publishing package on writing in reaction to information on the Internet
-To allow our pupils to communicate with pupils in the countries Marchal passes through
-To introduce pupils to the wonderful world of Amateur Radio.

The classes

The whole school i.e. about 800 pupils aged 11-18, plus all the participating pupils in the countries Marchal passes through.

The subjects

This is a multi- and cross-disciplinary project; the majority of teachers from Gaston Febus are involved.

The schools involved

Lycee College Gaston Febus in Orthez, Tamalpais High School, Redwood High School and Drake High School in San Francisco, and several schools elsewhere in the USA, in Great Britain, Canada and Australia, all of which are linked by the Global Village project on the Internet.

Activation and Operation

As soon as Marchal arrives in a country, pupils from its schools will come to meet him and will communicate news by Internet or by amateur radio links if the Internet is not available. Pupils from Gaston Febus will then broadcast this news on news group pages (Global Village project), on their Web page on the Internet, on local radio, in the on-line press and in local newspapers, as well as to short-wave international radio stations - The

Voice of the Andes in Quito, Ecuador, Radio Australia International, Radio France International - either by Internet or by fax.

Project 'Amateur Radio Operator'

We will launch a National Appeal amongst amateur radio operators to help Marchal, himself a radio operator (F5TGY) to finance his project. The donations will be collected by the 'Association Basco-Bearnaise des Radioamateurs' in Pau, France. We shall work in partnership with the IDRE and the REF.

Activation and Operation

A national appeal will be launched to help Marchal to finance his project. Various partners will be sought.
An Amateur Radio Operator's Diploma will be created.
The Amateur Radio enthusiast Associations of the countries visited will be brought into the project.

The F5TGY 'Association Basco-Bearnaise des Radioamateurs' Contest

To obtain the Five Continents Supermarathon Diploma an amateur radio station will have to contact at least ten stations in the country where F5TGY happens to be at the time. This means, for example that a station contacted in the United States can oonly be valid for the diploma if Christophe Marchal is in the US on the day and at the time of the radio contact. Completed logs should be sent before 30 July 1996 to F5RKJ who is the QSL manager and judge of the contest. This contest will run from 25 May 08:00 UTC until 16 June 15:00 UTC. Each station contacted will count for one point, two points if this station is in the town where the marathon is taking place ON THAT DAY. In the log reports, the date and time (in universal time) of contact and the town and call sign of the correspondant must all be noted. The same station may only be contacted more than once if on a different band each time.

My old Elmer I had when I was 14 answered the question like this, How hot is your tuner getting? RF is energy, it is going to be radiated as RF or Heat. He then went on to expain IHHO that he considered Tuners with coax or balans was just making the operator feel good, that only ladder line was acceptable with a tuner. Actually he wasn't very humble about his opinions.

Mission Control Center
STS-65 Status Report #13
6 p.m. July 14, 1994

Columbia's astronauts continued around-the-clock science work in the Spacelab module housed in the payload bay, taking time to provide details of the STS-65 mission during an interview earlier today.

Commander Bob Cabana and Pilot Jim Halsell took time out of their schedules to talk with NBC's Today Show, Weekend edition, about the mission objectives and how they relate to future work on the International Space Station. They also discussed and compared their work as test pilots to being pilot astronauts. The interview is expected to air Sunday morning.

Mission Specialist Rick Hieb and Payload Specialist Chiaki Mukai each worked a full day in support of the second International Microgravity Laboratory mission, following a half day off each yesterday.

The remaining three astronauts aboard Columbia -- Carl Walz, Leroy Chiao and Don Thomas -- woke up a little more than an hour ago and will relieve the current shift of crew members about 8 p.m.

Columbia is circling the Earth every 90 minutes at an altitude of 163 nautical miles.

The Johnson Space Center newsroom is open between the hours of 7 a.m. and 6 p.m. during the week. NASA issues four status reports daily during the mission: Orbiter status reports from Mission Control at about 8 a.m. and 6 p.m., and science operations reports from Spacelab Mission Operations Control in Huntsville at approximately 6 a.m. and 6 p.m.

2556. IC-SM5 microphone pinout?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-20 00:00:00 UTC
From: wilson@afn.org
Message-ID: <4gd32r$6ch@huron.eel.ufl.edu>
Source record: 205406

I recently sold my IC720A and bought an IC706. I retained the SM5 microphone I was using with the older rig because I hoped to recycle it for use with the newer one.

Unfortunately, I am unable to locate the desk mic's pinout. It uses four conductors on its 8-pin round connector. The '706 uses an RJ45 telephone-style connector. Does anyone have docs on the former?

Or equivalently, I could infer an answer if I knew the wiring of the OPC-589, an ICOM kludge cable which adapts the 8-pin round to RJ45.

I just want to do it the right way (without using the kludge).

I'm glad to see this tuner/loss thing come to light.
Theres a LOT of hams out there that think that if they ditch their resonant, matched antennas and go to open wire line with a tuner/balun that they get a big boost in signal.

Used to be; back in the olde days you could take advantage of a tuners additional harmonic suppression. Now with the new rigs, this is no longer a problem

Could the bottom line here be:

You are better off with an antenna that requires no tuner i.e. parallel dipoles, seperate antennas that require no matching etc.

Wilderness Radio sells the Sierra, an all-band, very compact superhet CW transceiver kit. The rig uses band modules to eliminate band-switch wiring, relays, PIN diodes and other complicated circuitry. All controls and connectors are mounted on the PC board, so there's no chassis wiring. Wilderness also has a very popular single-band kit (the NorCal 40A) as well as the KC1 universal keyer/frequency counter for QRP rigs.

If you have technical questions, I'm the guy; I designed the kits, originally as club projects for the Northern California QRP Club. For other information call Bob Dyer at (415) 494-3806, or write to him at Wilderness Radio, P.O. Box 734, Los Altos, CA 94023-0734, U.S.A.

The problem with doing that, Jim, is that the impedance on the output of the tuner may not be anywhere near 50+j0 ohms. (After all, that's why we need tuners, no?) If you know where I can get a wattmeter I can insert into a feedline looking into 2000 - j600 or 2 + j750 ohms and get an accurate (or even approximate!) reading, please let me know!

>a feedline looking into 2000 - j600 or 2 + j750 ohms and get an accurate
>(or even approximate!) reading, please let me know!

One way around this problem would be to borrow a second, identical
tuner. Tune the first one into the antenna system as usual, for minimum
VSWR at the TX end. Then connect the second tuner back-to-back into a
50-ohm absorption wattmeter (or Bird 43 and dummy load) and tune that
one also for minimum VSWR at the TX end. The power loss (in dB) in a
single tuner will be one-half of the total.

That would get around the problem of measuring output power into an
arbitrary complex impedance, and also get around the problem that the
loss in any tuner will depend on the impedance to be matched.

Note also that the loss in a tuner that has more than two independent
adjustments (eg two variable Cs and a variable L) will also depend on
which combination of settings you choose. Even though there will be many
ways to achieve a 1:1 match, different combinations of settings will
affect the loaded Q and hence the loss.

All you need to do is find someone else who has the same kind of tuner
and is equally keen to know the losses.

2583. HF receive for Yaesu FRG9600??

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-21 00:00:00 UTC
From: "Michael G. Reiney" <mreiney@hevanet.com>
Message-ID: <4gg17t$qma@vista.hevanet.com>
Source record: 205314
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Is/was there available a HF receive option to the Yaesu FRG9600?
There's a blank spot on the board for the module. The software and PLL are set up to receive from zero to 999 MHz. if you use 73 MHz. first IF and high side LO injection.

Has anyone ever tried to build such an option?

Anybody interested in working on such an option? Except for the availability of the Xtal to get from 73 MHz. to 45 MHz. it should be pretty trivial.

>I recently purchased a Ford Explorer V8 - 2WD. I get some noise in my
>Alinco DX70T on HF. etc.

Dean, I have a '95 Ford Explorer. I have a slight defect in the windshield, and thought that I would have the TSB 95-11-3 noise reduction modification performed at the same time the windshield gets replaced, in case I decide to go HF mobile at some point in the future. I am waiting for the TSB parts to come in, and my dealer said there is no charge for the TSB update.

I tried a Sony 2010 on HF in the Explorer, and with the engine on there is plenty of noise. If interested, email me in a few weeks, and I will report on the noise reduction noted on the Sony 2010 after the TSB has been performed.

Message-ID: <1996Feb21.102035.114485@kuhub.cc.ukans.edu>
Source record: 205316

HAMMARLUND MINIATURE AIR VARIABLE CAPACITORS

::::::::::::::::::::

TYPE APC

Compact, hi-quality variables. Isolantite base. Screwdriver
or hex-wrench adjust.

APC-25 3.0 - 25 mmf 10 available
APC-140 6.7 - 140 mmf 3 "

TYPE MAPC

Midget padding, trimming and general purpose capacitors similar
type APC but smaller. Ideal for small space applications. Gap
.0135 inch. Rotors and stators are nickle-plated brass.
Nickle-plated beryllium copper wiper contact. Tapped (4-40
thread) brass studs in Steatite base permit mounting without
grounding rotor. Tested at 600 volts rms, 60 cps. Slotted
shafts for screwdriver or hex wrench.

MAPC-75 3.9 - 75 mmf 7 available
MAPC-25 2.6 - 25 mmf 18 "

TYPE ???

Identical in size and shape to the type APC, but have military
part number. Rotors and stators are silver plated (tarnished).
Please note that capacitance ranges and values for this
particular group are APPROXIMATE, subject to the accuracy
of my RLC tester.

922-0004-00 2.5 - 30 mmf 10 available
CA-290 3.5 - 60 mmf 8 "

::::::::::::::::::::::

Would anyone out there care to make an offer on these little jewels?

>And; I have a FT51R.
>How do I interface the two?

Howdy, try EZ Clone. It will program your FT-51R from Windows 95, DOS, and OS/2. (It even works on Windows NT and Unix.) A menu-driven, full screen text version is available as well as a command line version. (A GUI version will be available next month.) The cable is included.

For more info on EZ Clone, point your web browser at http://www.acsys.com or send email to ezclone@acsys.com

>which combination of settings you choose. Even though there will be many
>ways to achieve a 1:1 match, different combinations of settings will
>affect the loaded Q and hence the loss.

I have mentioned this in this group before. Without an OUTPUT indicator of some kind, you can effect a match with an infinite number of settings (of three variables). Only one will be the lowest loss condition. With components of reasonable unload Q, the differences between optimum an worst case can be many dB. Unfortunately, this is also true when running the above experiment. Therefore, the loss in one tuner may not be one half of the total.

Some of the blanket statements (not Ian's) in this thread cry out for rebuttal. To say a tuner is lossless is absurd. To say that an arbitrary tuner will be more efficient when the load Z is higher than lower or the converse is just not true or that the left side of the Smith chart is better than the right (which way are you holding it BTW?). Without more specificity as to the configuration of the tuner one cannot justify statements such as these.

In article <4gaeeo$o6d@abyss.West.Sun.COM>
myers@West.Sun.COM "Dana Myers" writes:

> I believe that 97.315(b)(3)(ii) specifically allows the modification of
> "an amplifier", not excluding a type accepted amplifier, by a licensee
> for use at the licensee's station.

Also:

97.315 Type acceptance of external RF power amplifiers. - (a) No
more than 1 unit of 1 model of an external RF power amplifier capable of
operation below 144 MHz may be constructed or modified during any
calendar year by an amateur operator for use at a station without a grant
of type acceptance. No amplifier capable of operation below 144 MHz may be
constructed or modified by a non-amateur operator without a grant of type
acceptance from the FCC.

Of course, the big problem with 97.315(a) is that the term "a station" is
not defined anywhere in Part 97. 97.3(a)(5) defines an "amateur station".
But my copy of 97.315(a) quoted above says neither this nor even "his
station", which might imply "the amateur station of said amateur operator".

So what do you think, a bus station or a subway station? Is it his
amateur station or any amateur station? BTW, does my copy of this section
have a typo? Does anyone read anything different in their own copy?

I guess the RCI 2950 and HR2600 transceivers that are extrememly
popular on CB don't really exist, then? They're entire radios,
not intended to be used as amplifiers.

...

>And besides all this, what mature person of sound mind would want to make
>it easy for someone else to cause other people problems? Or is it an ego
>thing? I'd sooner go on rec.science and describe how to mak

This looks like a gratuitous flame, I hope I'm mistaken....

Of course, there *are* legitimate reasons for radio amateurs to
modify transmitters, receivers, and amplifiers. The FCC rules
do allow this. The FCC rules also attempt to make it difficult to
market certain kinds of equipment, and the distinction is spelled
out in 97.317(c).

I can understand concern that widespread knowledge of methods to
modify commercial amplifiers for CB use endangers the ability to
market these amplifiers. However, amateurs are also legitimately
entitled to modify a commercially manufactured amplifier for use
in their station.

Frankly, people learn by sharing information, and the Usenet is
here to share information. As uncomfortable as one may be with it,
it is not illegal to share information about modifying commercially
made amateur radio amplifiers for amateur 10m use.

Some local amateurs do have the c5718 and both complained about the
mike. But, the first rig I bought was a C5600D which has the same kind
of mike, so I'm not spoiled with the use of knobs. :-)

Those local amateurs mentioned above got the hang of it in a few days.
I can imagine that someone who's used to operate a plain and simple
mike, will have some difficulties.

>a net and found myself off on some other memory channel (it uses the

>
>Happy DXing 73-K9JDU

The problem here is that the tuner loss can vary dramatically depending on the load impedance. The suggested method will tell you the loss when the tuner is presented with a purely resistive load, but not by the actual load presented by the feedline. If you know the load Z and have an RF ammeter you can calculate the output power as I^2*R where I = the magnitude of the output current and R = the resistive part of the load impedance. Or you can measure the RF output voltage and calculate the output power as V^2/R where V is the magnitude of the output voltage and R is the parallel equivalent R of the output Z. But you have to know the output Z.

FRIENDS,

If you would like a free copy of a radio database program that covers longwave, mediumwave, and shortwave with at least 4,000 of records, send your NAME, POSTAL ADDRESS, and EMAIL address to chuck@flinet, and I will return the program to you via EMAIL.

The program is not up to date! It is a program used during 1994 and hasn't be updated since. However, many of the records are still current for stations that do not change every quarter.

The program is good until June 6, 1996. After that it will not function.

Hope to hear from you and don't forget your Postal Address for registration and future information via mail..

All addresses will be kept confidential!

This is the first YAESU radio I've owned and I must say that I am quite favorably impressed. I have always been an ICOM fan when it comes to portables since my first Kenwood, a '2400. That radio turned me off to their product for quite a while and so far, I haven't seen anything to make me re-think that opinion. I must say at the outset that the FT-51R was not my first choice. I wanted something small to replace the Standarc C-508 I bought at Dayton. The 200mW transmitter just didn't cut it for me, but I liked the small size.

I decided on the Icom W-31a but that was not to be. I liked the features, the size, and just about everything else about it. I even pkunked down my money and bought one... However, when I got home and turned it on, I got right back in my car and brought it back to the dealer. I live about a mile, line-of-sight, from a major commercial 2-way site and there is a paging transmitter there right on the frequency used by the W-31's UHF IF. Needless to say, that dual-bander became a 2-meter only radio anywhere near my home.

Still looking for the ultimate "tiny" dual band HT, I next turned to the Kenwood TH-79A and the Yaesu FT-51R. I've never been impressed with the quality of either of these manufacturers and I was not very enthusiastic about the choice. I was able to get one of each of these two radios and put them through their paces on a service monitor and was impressed with the results of the FT-51R and quite disappointed with the TH-79A(d).

On VHF, both radios were pretty hot inside the 2-meter band and the Yaesu maintained the same sensitivity from 140 - 180 MHz with an average of .180 microvolts for 12dB SINAD. In the aircraft band, the sensitivity dropped to an average of about 0.65 microvolts (all sensitivity measurements are for a 12 dB SINAD result.) down to 115 MHz. At 110 MHz, it took 1.2 microvolts. The Kenwood, on the other hand, had a sensitivity of 0.175 - 0.180 inside the 2-meter band but rose continually to a top of 0.330 microvolts at 173 MHz, the top end of it's coverage. Going down in frequency, at 140 MHz, it jumped to 0.22 and maintained a 0.65 average down to 125 MHz. It jumped to 1.2 microvolts at 120 MHz and at 118 MHz, it's bottom end, it required 1.5 microvolts for 12 dB SINAD. Readings under 136 MHz were done in AM and above 136 MHz in FM mode. Clearly, if you want to do any listening in the aircraft band, the Yaesu will and the Kenwood won't.

On UHF, the Kenwood only covered 438 - 449.995 out of the box and I didn't have the keyboard mod to expand this coverage. It was comparable to the Yaesu in this range, averaging about 0.170 microvolts. The Yaesu covered 420 - 470 out of the box (The keyboard expand was enabled from the factory) and at 470, the worst case, was only down to 0.245 microvolts for 12 dB SINAD.

Using a lossy tee connector we attempted to de-sense the receiver while it was listening to a weak repeater. Using random signals in the 150 - 170 business band, the usual intermod cause in this area, even pumping 4 volts of rf into the lossy port caused no problems for either radio. Likewise, on UHF with an interference signal in the 450 - 470 commercial band.

The Kenwood dod beat the Yaesu in one category. RF power ouput. With the supplied battery pack fully charged, the Kenwood delivered 2.8 watts. After staying key down for 2 minutes, this dropped to 2.3 watts. After a 1 minute key iup recovery period, it returned to 2.4 watts. The Yaesu under the same conditions delivered 2.2 watts initially, dropping to 1.95 watts after 2 minutes and maintaining that value after the 1 minute recovery time. On UHF, The Kenwood delivered 2.3 watts, dropping to 1.9 and holding that after 1 minute. The Yaesu delivered only 1.2 watts initially, dropping to 1.0 watts after 2 minutes and maintaining that level after recovery. Interestingly, the Yaesu was consistantly 750 Hz low in frequency, but the Kenwood started at 350 Hz high and ended the test on frequency.

On the service monitor, the Yaesu was the winner, but there were several other factors which made my decision for me. The FT-51R has a positive metal latch to hold the battery in place, making the electrical contacts with gold plated, spring loaded push pins to gold plated contacts on the battery. The TH-79A(d) used 2 tin plated leaf contacts to contact 2 tin plated contacts on the battery. The Kenwood battery was held in the radio by a plastic flap attached to the bottom of the pack, used as a spring to engage some notches molded into the inside of the radio case. to remove the pack, you press in on this flap, releasing the two "fingers" hold on the case. I suspect that at some point in it's life, this flap will become fatigued to the point where it either loses enogh of it's spring that it no longer reliably locks into the case or just breaks off altogether, rendering the pack useless.

The kenwood was also taller than the Yaesu with the supplied battery pack and size was my origional criteria. :) After the tests, the Kenwood went back to the dealer and the Yaesu has been on my belt for about a month now and I'm very happy with it. I haven't done the out-of-band transmit mod yet so I can't tell you from personal experience how that works, but from a friend who has done the mod, it does deliver most of it's rated power accross the range it covers.

I didn't intend to be so long winded, but I hope this helps.

2604. Lithium battery usage...

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-21 00:00:00 UTC
From: byoung@qni.com
Message-ID: <4ged4f$5vf@suba01.suba.com>
Source record: 205438

To All,

I wanted to run something by the group for some feedback and comments...

I own a Yaesu FT-10 that I run off of the "standard" NiCd battery packs. Like many (most?) people, I also purchased an alkaline battery holder so that I would have an alternative should my NiCds fail or if I needed to operate in an emergency where AC was not available for recharging.

Follow me for a minute...

The FT-10/40 radios utilize the FNB-41, a 9.6volt NiCd battery pack, to produce 5 watts of output. They can also run on 12 volts supplied via the EDC-5B car adapter for the same 5 watts output.

The FBA-15 battery holder takes four "AA" size batteries. Normally you'd use four alkaline batteries @ 1.5 volts each to obtain 6 volts and 2.5 watts output.

"AA" size lithium batteries are usually 3 volts each with much higher current. Given that they cost *MUCH* more than alkalines, they last "forever" in storage, and would also provide extended service during the emergency we're planning for (due to greater mA rating).

Would it be possible to utilize four lithium batteries @ 3 volts each in an FNB-15 to obtain 12 volts and 5 watts output? If it's possible, would it actually be beneficial from the aspect of power "per pound/per dollar"?

From: w8jitom@aol.com
Message-ID: <4gf70b$3op@newsbf02.news.aol.com>
Source record: 205444

In article <1996Feb19.170526.1579@ke4zv.atl.ga.us>, gary@ke4zv.atl.ga.us (Gary Coffman) writes:
>That doesn't apply to any amateur gear except HF external amplifiers
>because *no other amateur gear requires Type Acceptance*.

1.) D+A Raider manufactured an "amateur transmitter" with a crystal oscillator and PA stage. There were letters floating around describing how to move a few wires and use it as an amplifier. The FCC decided it was a transmitter intended for CB (in spite of the manufacturer's claim) and it was forced off the market because it failed part 95.

2.) Black Cat manufactured what they called "receiving amplifiers" that used 6AQ5's and similar audio tubes. The FCC decided it was really a CB amp and they were confiscated and fined.

>operating over 30 MHz require Part 15 Type Certification, which is a
>*very* different thing, but no amateur *transmitter* requires Type
>Acceptance. None, nada, zip.

Except if it appears to be a CB transmitter. BTW receivers that meet certain criteria and cover the CB band require 15 Certification.

>You could market a 1 kW 10 meter AM
>transmitter if you wanted, and not need FCC approval at all.

Not me, maybe you can! Black Cat and other companies tried that one. It didn't work. The device can be called or sold as anything, it's what the FCC decides it is that matters.

>FCC only requires Type Acceptance for *external* power amplifiers,
>not for whole amateur transmitters. The fact that such a transmitter
>could easily be retuned to CB doesn't even enter into the equation.

It sure does. If it didn't, the CB amp manufacturers would be using that technique! They have always been pretty resourceful in trying to make the amps anything from pre-amps to transmitters.

>The mods are *not* illegal. *Use* of the radio in a service that does
>require Type Accepted equipmnt *is* illegal, but the actual mod is
>not illegal.

It's illegal to manufacture an amplifier that can be converted to CB (or non-TA) use.

It's illegal for a manufacturer to give instructions that allow an amplifier to be used for non-TA use.

The very fact the amp can be modified can be cause for denial of TA.

>But since amateur gear (other than external power amplifiers below 144 MHz)
>does *not* require Type Acceptance, this point is moot. You no longer
>even have to use the FCC lab for Part 15 certifications (which receivers
>capable of operation over 30 MHz require). That can be done by an outside

>lab. So even that can't be used to hold up an amateur product by falsely
>claiming the equipment doesn't meet Part 15. And besides, any government
>employee who would falsify such a document could be subject to criminal
>penalties for perjury. An Executive Branch employee would be crazy to try

>something like that today. A call to a friendly Republican Congressman
>would have a special prosecutor on the job in nothing flat.

Ever been out in the real world? Next time you go to the airport, piss off the luggage handler. He'll grin and take it, but when you fly to Chicago your bag will go to Dallas. Even an honest "republican" won't help you. You can imagine what you like, but the FACT is if you piss people off they give you a hard time. I would venture to say 99 percent of the amps on the market would flunk if really held to the rules.

The only amp I've ever had to actually submit was a sweep tube amp, and they went over it with a fine tooth comb. I was told point blank they didn't like sweep tube amps, and if it started turning up with CB'ers TA would be dismissed. But I'm sure you have a reason WHY I wasn't told that. What has your actual experience dealing with the FCC on matters of part 15, 95 and 97 been, as opposed to what you think they can do?

And besides all this, what mature person of sound mind would want to make it easy for someone else to cause other people problems? Or is it an ego thing? I'd sooner go on rec.science and describe how to mak

2611. Tube INfo Needed

Newsgroup: rec.radio.amateur.equipment

Hello all
Here is the question...
Suddenly, my yaesu ft 101zd stopped putting out power....
maximum poser out now is about 5 watts
Is it possible that the 6146b tube or tubes could be bad?
would there still be a small amount of power out?
Could it be the 12by7a driver tube? and again, would there still
be a small amount of power out?

visually (which I know isn't much) they glow.

Taking it apart, I found NO scorch marks or burn marks anywhere.

Reply via e-mail if you can and thanks for your input

Ahem. Roy, the wattmeter only has to have the same impedance as the
characteristic impedance of the line, regardless of what load impedance
may be terminating the line. If the output coax is 50 ohms (the usual
case), then your trusty Bird 43 will work just fine. Of course, since
the line won't have a unity VSWR, you'll have to calculate true output
power from the forward and reverse readings on the wattmeter.

2622. 89 Ford Bronco static problem

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-21 00:00:00 UTC
From: scicon@ix.netcom.com
Message-ID: <4gg04u$k3h@ixnews4.ix.netcom.com>
Source record: 205456

I have a strange interference problem in my Bronco.

There is always a certain amount of static in the receiver, but it's not unbearable unless I turn the steering wheel to the left! When the wheel is moved to the left the static completely drowns out the receiver.

When I had my oil changed, the mechanic replaced the PCV valve. Now I get no static at all UNLESS the wheel is turned to the left.

Anyone have a similar problem?

2625. Accurate Instrument Model 257 tube tester?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-21 00:00:00 UTC
From: at770@cleveland.Freenet.Edu
Message-ID: <4gfitr$oh6@madeline.INS.CWRU.Edu>
Source record: 205459
Cross-posted to: freenet.rec.ham-radio.sale,freenet.rec.ham-radio.questions,freenet.rec.ham-radio.tech,rec.radio.swap,rec.radio.amateur.equipment,rec.audio.tubes,rec.antiques.radio+phono,sci.electronics.equipment,sci.electronics.repair

I am looking for information on a Accurate Instrument Co. Model 257 tube tester. The information that I am looking for is:

1) Operating manual
2) Schematic and servicing info
3) Tube charts and test data
4) Adapters, etc.
5) Offers to sell broken units for parts
6) Offers to purchase or trade for my unit

Please reply by e-mail, as I do not read these newsgroups very often.

Thanks
Frank

mparkes@aol.com (Mparkes) writes:

>I have a FT51r and can't seem to figure out how to clear an autodial
>memory when you want to put a new number in it's place.

Mike, put the radio in auto-dial mode, if necessary, by pressing
F-Call. Now the little telephone should appear on the right side of
the display. Now press the yellow F key again for about half a
second, and then press the number corresponding to the autodial memory
you want to clear. Let's say it's '2'. Then you should see a '2' and
a '00' in the display. Press the yellow F key yet again for half a
second. The '00' begins to blink. Now here's the trick: press the
sub-op key, which is just below the push-to-talk key. That'll clear
the auto-dial memory. Finally, press the 'call' key to accept the
changes. That will clear the autodial memory.

>The manual doesn't seem to explain it...I could do it with the ADMS
>software and reprogram the HT...

Or you could use EZ Clone to program the HT -- http://www.acsys.com or
ezclone@acsys.com

2633. HELP: buying GaAs FETs

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-22 00:00:00 UTC
From: jstocker@bode.ece.uiuc.edu
Message-ID: <4gip45$5tc@vixen.cso.uiuc.edu>
Source record: 205267

I am looking for a company from which I can buy a small
quantity (5-10) of low noise GaAs FETs. (specifically
MFG-1302 or MFG-1402 by mitsubishi).

In the past, I have dealt with Down East Microwave, but
there number is disconnected...did they go out of busines?
Did they move?

If you could give me the name and tele. number of a company,
it would be greatly appreciated.

According to the schematic supplied by Icom, the pinout is as follows:

PIN: USE:

1 Mic Audio
2 +8 VDC
3 UP/DOWN (Ground pin for UP. Ground through 470 Ohms for DOWN.)
4 N/C
5 PTT (Ground to Transmit)
6 Control & DC Ground
7 Mic Ground (shield)
8 SPKR Audio Output

Pins 1-7 are arranged in a circle with the keyway between pins 1 and 7
with pin 8 in the center.

Good luck,

Gary Kantor, WA2BAU

Source record: 205272

What's the best legal limit HF linear amplifier for use with a contemporary transceiver (e.g. TS-850, 870, 950, etc.). Which are the most trouble-free? What are the best tubes to look for in an amp? Which are the best used amps to look for, and at what price? Which amps are to be avoided? Which give you the best value per watt? How does the Tl-922A compare with Ameritrons or SB-220 or Henrys or Alphas? etc. I'm most interested in SSB operation on 20 mtrs, by the way, but also do some SSTV (very different demands, I know!). Many thanks for pondering these questions. 73 de John, KI7JB. <jtyoung@u.washington.edu>.

Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.misc

I'm still looking for an Icom IC2A/AT or equivalent handheld
2m radio. I've got a solar-powered project for which I need
a radio with low current drain while in squelched receive. The
Icom fits the bill, at about 20ma receive current.

Other radios would be acceptable, if they're fairly low-power.
I'm looking at non-2m-radio solutions, but this would be the
simplest way to do it, since I'll need to transmit intermittently
as well. Got one you want to sell? Send me mail!

Crystal-only types are fine too, since this will be a fixed-
frequency application. I'm not looking to spend huge dollars
here, but the radio doesn't have to be beautiful, either.

HI
I am quite new at this group, but radio communications allways was a subject very interesting to me.
I would like to know, to begin with, the price of some general purpose transceivers (radio emitter/receiver), might be material not very "high Tech".
For example the radio's might have analog "tunning", insted of encoder's frequency swichting or keyboard frequency operation.
Also they might be "analog inside", nothing like digital frequency tunning and channel programmed frequency set-up.
Another interesting feature would be to connect the radio to the PC, in order to establish a modem trought RF!!!
Please, do not became very technical in your answer.
I know some electronics, but mainly from data-acquisition and computer interface acquisition boards.
I also work with some VME modules.
Thanks in advance for your help.
Best regards.

Marine RDF's seem to have gone by the window of time. Everytime I go to a boat show, I always ask for them. The answer seems to be "If you had one today, you could sell it for a lot of money". 'Seems all the old ones were scarfed up by commercial fisherman. I understand someone produces one for a very large price, but not for me.
I was thinking that someone could design a signal analyser independent of the radio, and display the info on an LCD screen; sell a couple hundred and make out really good!

Bravo Mike.

That was a very good summation of amateur radio. I've saved it and
may print off copies from time to time for acquaintences who express
an interest. (Of course I'll preserve the attribution.)

2651. TS440S shut down problem on some bands

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-22 00:00:00 UTC
From: pj_duggan@nt.com
Message-ID: <pj_duggan-220296134412@ngalm402.gal.nt.com>
Source record: 205335

Hi Guys,

I am having a problem with my TS440S HF Rig. It shuts down between 14.5MHz and 22MHz. Get no audio from speaker and 7 dots on the display. Fault sometimes occurs between 22MHz and 30MHz. But this seems to correct itself after 15 minutes of power on. Fault is present for both transmit and receive. Relays on the ATU board and filter board seem to function O.K. for the different bands including the problem ones mentioned above.

Does any one have any ideas on the above?? or has anyone experienced similiar problems with Kenwoods TS440s??
Does a workshop manual exist other than the owners handbook? If so where can I get one??

2652. Help with Azden PCS-3000

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-22 00:00:00 UTC
From: Rob Neff <n7ory@primenet.com>
Message-ID: <312C925C.5BA7@primenet.com>
Source record: 205336

Howdy!
I have a guy in the area that has inherited a PCS-3000 (KB7ZHH, Bob). He tells me that the CTCSS tone encoder freq has to be set
on the inside of the radio somehow. However, he does not have any information on how and where this is done. He says that someone
told him that they had set the tone for 162.2, and that it used to bring up a few PL'ed repeaters, but not all of them. I
figured that the level might need to be adjusted but, he told me that since the last time he used it, it won't bring them up at
all. Sounds like more than a level problem now. If anyone has any information about the PCS-3000 and the CTCSS tone encoder in it,
he would greatly appreciate it. Or perhaps a schematic?
Please email me with any information, for he does not have a net address.

Thanks for your time.

Mark:

I'm no expert on the subject. In fact, I don't even have my license...yet. But for what it's
worth, I did purchase a TS-870S for use as a high-end receiver. The TS-870S, as you know, has
the DSP (Digital Signal Processing), and it really makes a difference! You don't have to buy any
filters for it...it's all built in! The computer control software (included) is super! The extra 50W in the 950 might get you out just a little further, but remember, you can't talk to
someone you can't hear!

I agree 100%. The 950 has been out for *many* years, and it's a good radio, but outside of the second receiver, there's
no compelling reason to select it over the '870. Time has passed it by, and undoubtedly, Kenwood will be coming out
with an advanced dual receiver rig to replace it. If the used '950 were really much less expensive, and you owned a
good audio DSP, it may be worth considering, especially if you REALLY NEED dual receive and it isn't just a toy.

2661. WTB: Two scanners with 800 MHz, cellular coverage not needed

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-22 00:00:00 UTC
From: QRP%mimi@magic.itg.ti.com
Message-ID: <4ghsif$dpa@mksrv1.dseg.ti.com>
Source record: 205345
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.scanner

My local police and fire departments are getting ready to switch from high VHF and UHF to 800 MHz, and I don't have a scanner that will receive 800 MHz. Serious bummer! I don't need anything fancy, and I don't want to spend lots of money. I couldn't care less if the cellular bands are un-blocked, as I have no desire to eaves-drop on peoples' private conversations. I'd like to find one handheld and one desk top scanners which cover the following bands:

29 - 54, 108 - 136, 136 - 174, 406 - 512, 800 - 900

The handheld must accept NiCd batteries. The desk top must run on 115 VAC and 13.8 VDC. Anything I buy will be in nice condition, with no modifications, and with manual (and preferably with the original boxes, packing, etc). Whatcha got that I can use? Please e-mail or phone me.
Thanks!

Most likely cause is bad adjustment of the VCOs on the output loop of
the synthesiser. Most rigs split the 30 MHz osc tuning range into 3 or 4
oscillators. There isn't much tuning voltage swing and adjustment is a
bit critical. Drifts as the radio ages and some freqs hit the tuning
endstops of the VCO, loop unlocks an TX shutdown activated plus other
warnings like your display.

There is a proper service manual with fault finding trees and circuit
descriptions available via Kenwood agents.

If this is it, it's pretty easy to fix, no parts needed, just a
voltmeter and a twiddler tool. Bog standard fault on just about all synth
HF rigs.

Cheers
David GM4ZNX

2670. Fix on Astron Power Supply

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-22 00:00:00 UTC
From: T E I X E I R A <teixeira@ccnet.com>
Message-ID: <4gi94f$71r@ccnet2.ccnet.com>
Source record: 205354

About a year ago I posted a problem with my Astron RS12A. I use the supply for a 2 meter mobil rig only. When operating on 40 meter CW (not connected to the Astron) The voltage on the Astron would jump to 18v and shut down. Sounds weird but there were others on the net who had similar problems whith Astrons. I had been using an extension cord to the power supply. I eliminated the cord and this helped.....not a cure.

So.....I picked up a 2" od ferrite loop and coiled the 110v power cord around it about 5 times and the problem seems to have gone away.

Before you adjust anything, scrape the gooey wax off of the components in the PLL section. I think that is where the wax is that a friend who had the exact same problem removed and fixed his 440.

>of reasonable unload Q, the differences between optimum an worst case can be
>many dB. Unfortunately, this is also true when running the above experiment.
>Therefore, the loss in one tuner may not be one half of the total.

Wes is absolutely right, of course! When using two identical tuners with three adjustments each, you'd need to set one (any one) adjustment in the tuner 2 to exactly the same as in tuner 1. The other two adjustments in tuner 2 should then come out the same when you tune for minimum VSWR.

Buddhist master says: You can never adjust your antenna tuner the same twice.

Zen Buddhist master says: You can never adjust your antenna tuner the same even once!

> after the car warms up, but is still there.

Both of my Jeeps, a Cherokee and a Comanche, had noise problems,
and other electrical problems, when I got them. After a lot of
hair pulling, I discovered the reason. The parts are painted
before assembly, thus there is an extremely poor electrical
bond between components.

On my Comanche, I actually disassembled the vehicle and sanded
off the paint on mating surfaces. On the Cherokee I just added
a bunch of star washers to bite through the paint and added a
bunch of copper straps to bond panels together. The Comanche
fix works better, but the Cherokee is tolerable now too. The
horns now work, the dash lights don't dim when the air conditioner
comes on, or blink in step with the turn signals, and best of all
the noise in the radios is virtually gone.

Besides improving bonding, specific things you should check
with ignition noise is that the proper resistor plugs and
resistor wires are being used, and that the cap and rotor
don't have carbon tracks. The latter can generate fierce
noise, and make the engine idle rough too.

>comment?

The thermal latency resulting from "insulating" the tuner in another
container would complicate taking the reading. I'd be more interested
in finding a suitable dielectric liquid.

The First thing I look for is the radio that has the most metal in the case. Yes the most! I realize that is not the lightest, but it is definately the best for performance. You must consider that the antenna used on these portable radios is a 1/2 wave, ok a 1/4 wave whip with the case of the radio being the other 1/4 wave. If you have a lossy bottom half to your dipole do you expect it to perform well? Think about it.

I too own a FT-10 and have not tried that idea. I would think that your logic shouldn't too far off, but to test it I would try mixing in two lithiums and 2 alkaline for 9 volts, just incase there is something about the radio not liking the 12 volts of input through the internal contacts.

My long term cost solution is to used a lead acid battery that you could charge on AC and use the DC adapter to draw the 12 amps. Costs would even out by the 3rd set of lithiums I would think. HRO has one that is 8 amp hours for $70 .

>This isn't really a realistic impedance, since even a tiny bit of feedline
>loss would lower the SWR below this value.

I'd be hard-pressed to resolve a 100 watt difference on a 250kW Bird
slug ;-)

I would think a calorimetric measurement would provide more accurate
results, although the technique for doing such that doesn't
require submersion may not be all that easy to do at home.
I would imagine that it would be more difficult to make and use
an air-based calorimeter, especially one that would yield results
as accurate as a submersion-based one. Maybe the tuner could be
placed in a thermally-conductive, liquid-tight container and
then submerged? Anyone with more knowledge on the subject care to
comment?

Also, this all may be for naught as the losses in the tuner will
vary greatly with load impedance and frequency among other things,
so a few data points would only give a general picture of the
efficiency of a particular tuner.

>HELP!!!!!! I have a Kenwood TH-78A and I can't seem to listen to anything
>on the left side of the display.
>Nitin Natarajan
>N1GSK

Hello Nitin,

Without knowing what you've already tried, it's hard to help without seeing the radio, but for starters, make sure the radio PTT display is on the left side. Then make sure that the "V" number (volume) is able to be adjusted to around V10. Sometimes the volume control on modern HT's can be a bit confusing about which band you are affecting.

Also, may sure the "CT" is not displayed on the left top side. This indicates that the tone decoder is engaged. (This is probably not your problem seeing that you reset the unit).

There are a couple different modes of configuring the top rotary knobs, and knowing what each knob does for you might show a reason for the problem as well.

Good luck. E-mail me if I can be of further assistance. Brian N6ZAU

Gary's right -- I shouldn't have dismissed the directional wattmeter out of
hand.

Using the impedances I snatched from the air:

2000 - j600 is an SWR of 43.6 in a 50 ohm system. This probably isn't
an unreasonably high SWR to see with a multi-band antenna fed with
ladder or open wire line. With 100 watts of power, the trusty Bird should
read a forward power of 1141 watts and reverse power of 1041 watts. It
might be possible to resolve the difference well enough to get an idea of
the actual power being transmitted.

The other impedance, 2 + j750 is a 50-ohm SWR of 5650, requiring the Bird
to read a forward power of 141,300 watts forward and 141,200 watts reverse.
This isn't really a realistic impedance, since even a tiny bit of feedline
loss would lower the SWR below this value.

So, the Bird 43 with a high-power slug might, after all, be adequate for
measuring the output power to determine loss, as long as the SWR (in the 50
ohm wattmeter) isn't too outrageous.

Thanks for the correction, Gary.

I placed my original order for this kit back in 2/94... It took a while, but it showed up last night!!! Looks like they solved the alignment problems, the faceplate problems, and the creeping featurism in the software, and they are now shipping. Unfortunately, my bench is too buried in other half-finished projects for me to start this one right now :-(

2708. Mounting detachable faceplate in car - Help!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-23 00:00:00 UTC
From: simont@post.its.mcw.edu
Message-ID: <4gl2s1$mbt@post.its.mcw.edu>
Source record: 205290

Hi there,

I have recently bought a Kenwood TS742 2m/70cm dualbander which has a detachable face plate to allow the radio to be installed in the trunk and the contols to be up front within reach. I have the radio installed under the passenger seat and the wires from the battery are in place without any problems. I am now trying to find a way to mount the faceplate, preferably without doing anything permanent to the car.

I was wondering if anyone can give me any tips on how this might be accomplished? If I have to drill some holes somewhere inconspicuous then so be it, but Im trying to avoid it if I can. I have a Honda Civic '94.

I have seen pictures of faceplates mounted on mobile phone 'goose necks' (flexible arms mounted to the car floor) which look very neat and tidy. Has anyone used this method and how easy is the installation of the goose neck?

Thanks for anyone who can help me here.

>Chuck, KE9UW
>

This is a problem with early models of the 440. There is 3 service
bulletins on the Kenwood BBS that address this problem with a fix.

The fix involves removing the VCOs and cleaning them of all the goo on the bottom and replacing the goo with hot glue. Could also be caused by leaky diodes in the VCO circuit. The fix when sent back to Kenwood runs about $150. Have them replace the lithium battery when they have it open.

Good luck

Charlie, sounds like a bad 12by7 or maybe you should check the large vertical plate choke located near the final tubes. This is the round vertical component that has wire wound on it and feeds the wires going to the top of the 6146's. If this has burn marks on it or is questionable--replace. Yaesu still sells them for a bout $9.00 each. Feel free to cal me at work if I can be any help. Neil @ Radio Recyclers--414.771.7121 Good luck!

Hi,

I am wondering if anyone can help me. A HAM friend of mine recently had one of the following implanted to help control his heart rate. This is not actually a pacer unit but should be similar. Along with the AICD unit was a warning to avoid close proximity with HAM radio equipment. Does anyone have any experience with one of these things and could give me some feedback to confirm or allay any fears my friend might have? Thanks.

Roberto,
I had the exact same problem. It turned out to be a defective wiring job in the VHF DB-9 connector. The audio input (2 wire subminiature phone plug) wires were incorrectly soldered in the DB-9. This seem like it should have absolutely no affect on the 'HF' side but it did. The bug drove me crazy for a couple of months. It also cost me a couple of output IC's on my ICOM VHF rig. Check out those connectors.

> I would like help on how to put in the PL in my YEASU 727R...Please
> let me know how to do it step by step...I got the radio used...Thanks...Jeff

First make sure you *have* the tone option. It was not standard
on the FT-727R. You need to remove the battery and then the battery
slide mount on the bottom of the radio. If you see a 3/4" by 3/4" IC mounted
on a 1" by 1 1/2" PC board, you have the PL option. The little pot on the
board is the PL level adjust. Reassemble everything.

To set the PL tone, you need to hold the function key (right side of radio, press
hard as the contacts may not be really clean, cleaning them wouldn't
be a bad idea) and press the 6 key on the DTMF pad (labled T SET above
the key.) If the display changes to 146. , then you didn't get the function
key pressed sufficiently hard or the contacts are really dirty. Otherwise
the current PL tone should appear on the display along with a little
TONE indicator in the upper right hand corner of the display. To change
the tone, simply press the up or down arrow buttons until the tone
you want is displayed. Finally hold the function key again and press the
6 button. That saves the new PL tone value.

Now you still need to turn on PL if it isn't already. When you transmit and
the PL encode is enabled, the display will show TONE in the upper right
hand corner. To toggle PL encoding, hold the function key and press the
8 key (T ENC) on the DTMF pad. When using PL decode for receive,
TONE will show up in upper right during receive. To toggle PL decode, hold
the function key and press the 5 key (T DEC) on the DTMF pad.

If you were asking how to install the FTS-6 Tone Squelch Unit, again
remove the battery pack and the battery slide mount from the bottom
of the radio. Locate the 1/8 watt 27 k ohm resistor that is inserted in one side
of the socket. Remove the resistor. Align the pins of the FTS-6 with the
socket (can only go one way because the sides have different number
of pins) and press the FTS-6 into place. Adjust the tone deviation if
necessary by adjusting the potentiometer that is on the FTS-6 board.
Then reattach the battery slide plate and reconnect the battery and
follow the instructions above for setting tone and enabling/disabling
encode and decode.

73,
Todd

2721. Battery charging question

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-23 00:00:00 UTC
From: Jeff Clark <jefco@got.net>
Message-ID: <312E3FF4.3DEC@got.net>
Source record: 205303

I recently purchased a brand new Icom IC-W31A HT dual bander with one of those slim battery packs which slides into the back of the unit. There's a single external power jack on top of the unit (none on the battery) which requires that the battery be in the radio when charging.

Without spending $150 on a rapid charger, is there any way to charge the battery externally? The battery has three contacts; one each marked "+" and "-" and a center contact w/no markings. Would connecting a 70 mAh wall charger to the "+" & "-" contacts for the usual 12-14 hrs do the trick?

I checked the charging current of the stock wall charger which came with the radio. With the radio off, current is 70mA even though the rated capacity of the charger is 200 mAh. I assume this means there is some regulation going on inside the radio to limit battery damage in the case of overcharging.

Please direct responses via email as well as to the group; my Usenet server has been having intermittent problems.

Thanks & 73,

Thanks, Dave and Robert. I just got an E-DC-12 today. I bought the
FT-51R(H), and have just the one 9.6 V battery. I had bought the AA
battery case, and plan on using mostly AA's when away from AC. I rigged a
2A 12 VDC power supply with a cigarette lighter socket, and plan to use
that when at home connected to an outdoor antenna (no base rig yet). Agree
with your thinking 100%, although the charging rate when connected to a
12V source via the E-DC-12 is probably pretty slow.

So I have another question - why are there any contacts on the back of the
FBA-14 AA battery tray? Do those pass through in any way? I may have to
buy a 4.8 V battery just so the handling of the battery in the car is
easier - the 9.6 V battery seems huge compared to the tiny radio.

I wish that Yaesu had put a DC jack somewhere on the rig, seems like every other HT has one...but otherwise it is nifty!

>
> Any suggestions for a dual-band HT in general?
>
> StephenI have an older modified Th-78 that recieves 138 to 174mgz and 400 to 500 mgz, its for sale but it has a couple of problems. Its a dual band HT 2m/440 Ht, but the VHF volume control does now work properly when the radio is in the dual band recieve mode. If you use the radio as a single bander (either vhf or uhf) it works fine and the second problem it that the sub-audible tone (PL)on Transmit does not work. On the better side the radio has 100 and alpha -numeric display , which is expandable to 250 memories. Have a 1200 mah long life battery and a 600mah battery with a 1 hour rapid charger. the radio also has ; backlit keypad , direct entry keypadbuilt in time clock w/alarm battery saver and many more features.I think there might even be a Mod for 800mgz I am asking $250 or best offer I can be reached at 201-584-6550 days or 201-770-0242 eves and weekends or E-Mail me at bill@nji.com Thanks

To Everyone:

Good news. How many of you are using ""NI-MH""(Nickle-metahydrigt?!)? I got one recently in TRW swapmeet in L.A, clifornia. Even Periphex don't have them. Their size are so small and so big capacity. Like a PB-33 600mah ni-cd is "equal" to the size of PB-33 1200mah ni-mh. And they also have less memmory. The brand is MAHA COMMUNICATIONS. They have all kind of battery and "very" heartgrabing prices. Anyone got Yaesu FT-10R/40R? they have the only 3rd party replacement battery of FNB-41 for only $39 (US!!). Give them a call at 800-376-9992.

Wondered if anyone knows how to adjust the DTMF autodial speed on the 51r? The manual staes that you can toggle it between 2 different sending speeds, but either setting doesn't make any difference. Am I doing something wrong, or is this a fault of the rig/manual? I've also tried using the ADMS software to change it but again, no difference.
Thanks for any feedback, Mike KS4DA

> cleaned me out for a little while.

I bought a Yaesu MH12-AB, very simple speaker mike. It was recommended as
having slightly better audio than some other Yaesu alternatives. I saw one
today at Radio Shack, catalog # 19-310 which has a plug to pit the Yaesu
rigs, and it was only $20. You might try it if you want something
inexpensive.

Don't know about how the mike may affect the radio, but make sure the
impedance is similar. The manual discusses this.

I was told that I "sounded much better" with the new remote mike, but then
I put up an external antenna the same day.

good luck

Definitely clean out the goo in the PLLs, they're the things in the little metal square cans on one of the boards. You'll need a scraper, xacto knife, and dental picks. SCREW the HOT GLUE! Dumb idea, since you cannot get all of the old goo out, and the residual will eventually cause more problems. The stuff they used is like "Pliobond" a Goodyear "rubber cement." It eventually hardens, and then becomes rather conductive, loading down the PLL, which will drop in and out depending upon time of day, temperature and the moon.

The ONLY way to really fix it is to carefully desolder each and every component in the PLL circuit area and scrape the crap off them and the board.

I'd like to strangle the Flaming JERK who designed this with this awful "potting compound." What a fool. I've been into my 44o at least 6 times to clean them out, since it's really a pain in the butt to remove the entire board and go through the desoldering of about 250 components.

Unless you're going mobile, skip the HOT GLUE. A) it's a lousy thermal conductor, B) it doesn't like heat and C) try to get that out later! As a mechanical damping and stabilizing compound for the PLL, I guess it will do, but if the unit sits on your desk, who cares??

Pedro:

Welcome to this new group. You share a common fascination regarding radio that most of us in this new group also share.

You can actually get started very nicely in this hobby for $400.00! That will buy you an old HF rig like the Yaesu ft-101, Kenwood TS-520, etc. You'll have plenty of power to talk around the world and enough change from your purchase to buy a $50.00 (or build) multi-band dipole antenna such as a G5RV. I'm using a G5RV as my only antenna and it works on all HF bands between 10 and 80 meters.

Even a new "state of the art" first radio can be purchased for approximately $1,000 U.S. dollars. They are quite a value compared to the radios produced 20 years ago.

I'm not sure how good the old radios are in the digital modes; I'll let someone more experience than I answer that particular question.

Pedro, best regards and good luck.

2745. mounting faceplate in car

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-24 00:00:00 UTC
From: davek@yoda.psu.edu
Message-ID: <davek.373.312E6FB2@yoda.psu.edu>
Source record: 205230

Someone recently asked for suggestions on how to mount a detachable radio faceplate in a subcompact car. Here's how I did it:

Buy a replacement ash tray that matches the one already in your car, and drill holes for the mounting bracket in the face of either ash tray. With the faceplate mounted on the ash tray, it won't block other dashboard controls. Also, you can take the faceplate/ash tray assembly out of the dashboard and hide it under a seat whenever you leave your car unattended for a long period of time. If you ever sell the car, remove the faceplate/ash tray assembly and replace it with your spare, unblemished ash tray. Make sure you get the spare ash tray soon while they're still in stock!

Hope you can use this suggestion.

>Unfortunately, most motorola equipment is PM as opposed to FM....This means that for 9600 baud use, you will have to modify the radio. Specifically, you will need to "break in" to the channel elements (where the actual oscilator is) and inject audio directly into the varactor diode to achieve true frequency modulation. The reciever signal can be obtained directly from the discriminator. Some of the later radios, (i.e. the maxtrac) may not be usable for 9600 baud. I am not sure whether they can be "fm'ed" or not.

By the way, the pager base station you listed is 1/4 KW or higher (Probably 330 watt). In most areas, 9600 baud is restricted 220 Mhz. and above.....for 1200 baud operation, just connect the afsk audio from the tnc to the transmitter's mic input and the speaker audio out (with a little padding) to the tnc's audio input. Have fun. KN6UG

TRUE.

We have modified several Mitrek radios for 9600 baud use. TX audio was
wired directly to the channel element socket, but we did not have to get
"inside" the channel element. I suspect the same would be true for the Micor.
Maxtrac and Radius are synthesized radios. There is no "channel element".
I do plan on researching putting these radios onto 9600 baud sometime maybe
this year. I have copy of the mods for the Mitrek, (supplied by other hams)
at work. Hopefully I can get these copied next week and send to you. Call me
back if you don't hear from me in time. If anyone else is interested, perhaps
I can retype these sheets and post to this group.

>let me know how to do it step by step...I got the radio used...Thanks...Jeff

Hi Jeff,

Here is what you need to do to install the PL board into an FT-727R HT.....

- Remove the battery
- Remove the 4 screws on the bottom of the radio
- Lift off the black bottom of radio battery cover plate
- Place and press in the FTS-6 tone board
- Reassemble the radio.

- All Done !!

Good Luck and 73's

Kevin, WD6DIH

Snicker. And theoretically a bumble bee can't fly. When reality doesn't
match your theory, your theory is wrong (or at best is being misapplied).
No tuner has infinite unloaded Q, so all tuners dissipate power. The
question of interest is "how much?"

Gary

>read a forward power of 1141 watts and reverse power of 1041 watts. It
>might be possible to resolve the difference well enough to get an idea of
>the actual power being transmitted.

Yeah, that's about a 10% difference in reading. Now a Bird is only
rated for 3% of full scale accuracy, but we aren't concerned about
that here. That will cancel out when we subtract the relative readings.
In this case, depending on the slug chosen, we should be able to
resolve down to between 3% to 6% of true power out (the real limitation
being how well we can interpolate the meter scale, which we *could*
expand if we wanted to take the trouble). If the tuner has less loss
than that, we won't be able to resolve it, IE if tuner loss is less
than 0.27 db, we won't be able to see it on the Bird. I don't think
we'd care too much about that anyway.

However, the *coax* tuner that started this thread wouldn't be used
with that high a VSWR anyway. Line losses, and even the possibility
of flashover, would limit the impedances we'd try to tune with a
coax tuner to a range that produced VSWRs more on the order of 10:1
or less. For that sort of measurement, the Bird is just fine.

For a balanced tuner, we'd want to use hot wire ammeters, and a RF
voltmeter that we could move along the line, to determine power out.
The RF voltmeter would let us directly determine VSWR and give us
a direct tuner output voltage reading. Combined with the RF current
readings of the hot wire ammeters (one in each leg) we could then
determine power out by cranking the formulas.

2757. Ten Tec SCOUT -- opinions?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-24 00:00:00 UTC
From: jwg6@cornell.edu
Message-ID: <jwg6-2402960716460001@cu-dialup-0701.cit.cornell.edu>
Source record: 205242

I am considering the Scout for my HF rig. Some things I've learned on the air are:

There's no RF gain control
It's analog (VFO), so temperature can affect freq. stability
No 6-meter module available

I'd appreciate comments regarding the rig and also info on the Ten Tec 6 meter transverter which I understand converts from 20 meters, not 10.

Does Scout come with a Mic?

Have owned Argonaut and Century 21 in the past; was spoiled by the full-break in and quality of manufacturing and service provided by Ten Tec. Now borrowing an Icom 730 - nice but not the same. Unfortunately I can't afford one of the new Kenwoods; have used TS440 quite a bit at club station, but my interest in QRP has me leaning toward the low-power version of the Scout. Thanks in advance and 73, N1AEP

I still have the T-599 and R-599a, but have only fired up the receiver
recently. I was very pleased with their operation, though, and the only
reasons I replaced them with another rig was to get on the new (at that time)
ham bands, and to have a little easier setup for cw operation.

Bill, I tried 1.5v lithium batterys in my HT once and found that the
internal resistance was quite high and did not work very well. But these
were early Eveready prototype which may never have gone to market. In
any case do not give the radio to much voltage, you will need only half
the batteries and a jumper. Give it a try, they are much lighter too.

2772. TR7 Tuning Pushbutton Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-24 00:00:00 UTC
From: cdorn@gpu.srv.ualberta.ca
Message-ID: <4gntcs$10b8@pulp.ucs.ualberta.ca>
Source record: 205257

Hi,
Figures as soon as I start looking for filters for the Drake TR7 something goes wrong. I was using the rig this weekend (I have only had it for about 4 months now), and tuning around, and the UP contact pushbutton that increases the tuning by 500KHz stopped working. The VFO and DOWN button still work. I could not see anything obviously wrong with the pushbutton. I don't have a service manual, and the owner's manual isn't much help. Anyone had this problem? Is it likely just the pushbutton? I can't access some of the shortwave bands without the UP command.
Thanks,
Chris VE6RDC

2773. HARVEY WELLS TBS-50C 3.5-144MHZ XMTR with 807 Tube

Source record: 205258

I went to a local ham swap meet and found an old
Harvey Wells T-50C 807 Xmtr. Does anyone have a book
on it. (Harvey Wells BandMaster Senior) TBS-50C 807 tube
When I got into ham radio 25 years ago, when I first got
my license had one.
It was one of the first Tube xmtr's to cover 3.5MHz to 144MHz
, and one of the first commercial rigs after WW2(1940's).
I guess it was akin the the new Icom 706 (HF to 2meters) now but
for nearly 50 years ago.(Tube version of IC-706, but 50 years ago.)
Right now I am using as a paper weight, I put my Icom 706 on top
of it to remind me how ham radio stuff has really progressed!
Anyway, if anyone has a book on such an item, I would like to get a
copy, maybe even try to get to work on HF-2meters, compare it to the
new Icom 706, sidse by side comparison, model T vs lexus.
thanks
73
Mike

With all the fuss over technical aspects of power loss thru an antenna tuner (FEEDLINE TUNER!), couldn't we just sidestep all the BS by just stating that a well designed tuner, operating properly, will consume *NEGLIGIBLE* power. so little as to be difficult to measure, and IMPOSSIBLE to detect at the receiving end?

SEE, that wasn't hard...

I have the radio, works OK! I prefer its small, but
not teeny-tiny size, and it has a lot of features. I have
the mating DJ-560 dual bander so I can share batteries
and acessories. It has 20 channels (+1call ch), battery
saver, APO and all the DTMF paging that most HT's have.
The radio also can be converted, by sniping one wire, to
receive AM aircraft band. I also bought a service manual
for $10 from ALINCO as well as some other reasonably
priced parts for other radios. Can't complain! 73's....

2780. 49MHZ TO 6 METER conversion

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-25 00:00:00 UTC
From: dll@chattanooga.net
Message-ID: <4goplk$pvn@news.chattanooga.net>
Source record: 205180

Hello,
I read an article in BARC FTP archives and I would like to do this mod, but I need help. The article talks about converting a 49 mhz radio shack walkie talkie to a one channel 6 meter xciever. Our city's one 6 meter repeater is on a mountain overlooking the whole city so I dont neeed any more than this. The "talkie" I have came with no paperwork (Yeah..I know...Radio Shaft at its finest). It is a TRC-509 that uses 2 crystals.
My problem is that I know nothing about crystals. Can anyone help me with figuring the;

1:Load Capacitance
2:holder style
3:calibration accuracy

for the crystals I need? Thanks for any help. (Im still learning with every project)

2781. IC-W31A Extended RX Mod

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-25 00:00:00 UTC
From: lui@netcom.com
Message-ID: <lui-2402960040560001@arrington.dscnet.com>
Source record: 205181

The ICOM IC-W31A HT has all of the features I want except the receive range only extends to 470 MHz and I want to receive up to at least 475 MHz. Does anyone know of any modifications to extend the receive frequency? Any other mods? I looked at the mods on oak.oakland.edu, but couldn't find anything for the IC-W31A.

2783. INFO on UHF PMR conversions please

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-25 00:00:00 UTC
From: Graham M Masterson <graham@grahamm.demon.co.uk>
Message-ID: <0IvVeDADbDMxEwLA@grahamm.demon.co.uk>
Source record: 205183

I have two commercial PMR rigs which I would like to convert to UK
70cms.

They are a Stornophone 4000 which should only require re-programming of
a 2764 (I hope) and a Motorola GP300 which I guess I shoud be able to
reprogram via a serial port (if I am right).

I would appreciate any info anyone may have on these rigs that will
assist in the conversion.

Thanks.

From: WA6MHA@WB6WFH
Subject: WIRING OF TS-440 ACC-2

USING THE ACC-2 DATA JACK ON THE TS-440/TS-680 FOR DIGITAL & RTTY MODES

The TS-440 ACC-2 jack (13) pin can be used for your TNC hookup with
great success. The advantages are :

1. You can leave your microphone connected at all times
2. You can turn your speaker volume up and down without affecting
the RX level into your TNC.
3. It keeps your whole setup simple and reduces it to one cable.
4. Your Mic gain will now be set at 7 or 8 on its dial. YES!

The pins used on ACC-2 are: (see page 11 of TS-440 manual)
(3) Data output. This is a constant 300mv output that will go to your
TNC audio input lead. Note: This audio level is also the audio output
on the RCA jack used for FSK output. This is where many hook up their
phone patch.

The audio output may be too hot for some TNC units. If so, you
will have to pad down this level with resistors. My KAM wants to see
50mv and it's seeing 300mv. So far so good!

(4) Microphone shield (Ground)

(9) Microphone Mute. When pulled to ground, this pin will mute the
front Mic connector ** AS LONG AS THE PROCESSOR SWITCH IS OFF!**
If the switch is left on, the audio is pumped up too high to mute.
Connect this pin to your PTT wire from your TNC and also connect
the Cathode of a switching diode (1N4148, 1N914, etc). The Anode of the
diode will go to pin (13). (The cathode is the bar)

When pin 9 is pulled low by your PTT wire, the diode will cause
pin 12 to go low enough to put the TS-440 into transmit. This will both
mute the front Mic jack and transmit at the same time. Works great!

If the diode is not used, and the pins are just connected together,
the front Mic jack will mute itself when used. NOT A GOOD IDEA!

(11) This is your transmit audio in, from your TNC.
Setting of the MIC gain on front of radio:

1. The audio level in wants to be 500mv RMS (1.5 vpp or so). For the
KAM remove its jumper inside. This will give you max audio out of the TNC.

2. For the PK-232, turn up the audio output pot until you get 500mv
or so RMS. You may also want to set it to make your TS-440 mic gain pot
read where you want it. (MIC) will run around 7 or 8 for digital with
the KAM. I'm not sure for the PK-232. More level into the TS-440, lower
numbers on the audio pot (MIC)

(12) Ground for audio shield

(13) Standby (transmit). This connects to the Anode (no bar) of the
diode from pin (9). When pin (9) is pulled low, pin (13) will go low.

To sum it all up:

A. You will need:
1 ea diode, 1N914 OR 1N4148
1 ea 13 PIN DIN CONNECTOR
1 ea TNC cable with appropriate connectors

B. Remember to keep the PROCESSOR switch OFF!

C. Set the Mic gain to 7 or 8 and look at the ALC, keep it
in the red, as per the book. Lower power, longer transmit time!

This hookup in being used with three TS-440 radios and is working
great! Go slow and solder carefully. Please recheck your work and
then plug it in! 73 Glen, WA6MHA@WB6WFH

>I guess that you have never heard of an offset oscillator? I better tell my
>1 element Micor mobile repeater that it could not have been duplexing for
>the last 6 months. Know code?

If you are "Sorry for the flames" then why do you make them? This is a forum for technical discussion and exchange. Where is the requirement to insult the fellow? While both of your licenses are about the same vintage, you are about 11 years older than Sean. Perhaps you could be sharing greater experience, rather than casting insults about?

And what does the "Know code?" remark refer to? I don't see where the knowledge of morse code indicates anything in terms of technical knowledge. I've known quite a few professional radio techs who weren't amateurs and certainly did not know the code. I'm a No-Code Thank You Very Much Technician myself. And yet I'm responsible for maintaining 3 mountain-top repeaters covering most of Arizona, I hold an FCC GROL+Radar, have technical degrees in RF Communications and Computers, and I serve as a Senior Electronics Technician in a government agency. Oh yeah, almost forgot the NARTE Certification. Perhaps my being a Nationally Registered EMT will carry some weight? It shouldn't! It has about as much to do with technical electronics/RF knowledge as does Morse Code.

This isn't about bragging, it's about knowledge and the desire to learn and the willingness to teach. Offer your knowledge to others and you will receive their gratitude. Throw insults about, and the community that reads them will think the less of you.

>buy a 4.8 V battery just so the handling of the battery in the car is
>easier - the 9.6 V battery seems huge compared to the tiny radio.

It looks like the contacts on the battery tray are for an external power adapter. It looks like only the ground and external power lines are implemented, the charge line is not so it won't blow up your AA cells.

>I wish that Yaesu had put a DC jack somewhere on the rig, seems like every
>other HT has one...but otherwise it is nifty!

I Agree... I am tempted to take an FBA-14 and put a jack in it for external power to the radio... or I may just break down and buy the E-DC-12.

2803. Looking for attenuator

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-25 00:00:00 UTC
From: rroberts@mcs.com
Message-ID: <NEWTNews.825310863.19568.rroberts@rroberts.mcs.com>
Source record: 205203

Greetings,
I am looking for an active attenuator to be used on two meters. When I am foxhunting, I get swamped whenever I get close to the fox. I am using a KAY unit, and that works ok until I get close, then I get swamped. I have been told that I need the active attenuator so that I can hook it up to the beam and then adjust it so I can get closer before I get out with the ground gear. I have tried using a talkie with no duck, but not much luck.

I am looking for something already made up as I have had no luck with kits.

Any help would be appreciated.

Message-ID: <4gteau$ipe@nnrp1.news.primenet.com>
Source record: 205060

I've had the JPS NIR-10 for about two years now and have really enjoyed
using it. It really helps pulling weak signals out of the noise. The
filter really shows it's stuff on 40 meters cancelling the AM broadcast junk.

Press and hold [B]&[#] and turn power on. This will wideband receive.
Or:
1. Remove battery and antenna
2. Open radio
3. Locate logic board
4. Locate and remove Diode D15 (RX mod)
5. Locate and remove Diode D14 (TX mod)
6. reassemble radio,
then press and hold [B]&[#] and turn the power on.

2811. Plantronics telco Starset conversion?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-26 00:00:00 UTC
From: leber@voicenet.com
Message-ID: <leber-2602962112110001@philly347.voicenet.com>
Source record: 205063

Anyone out there ever adapted a Plantronics StarSet telephone headset for use with radios? I have two of these, and I'd love to modify them for use with HTs. They look identical to the type used by pilots & air traffic controllers, with the exception of the plug box/adapter (and they're beige instead of black).

>
> Roy Lewallen, W7EL

Roy, Do you think this would work -

1. Tune a tuner to its operating point to match a tranmitter to an
antenna.
2. Then, disconnect the tuner and measure its complex input impedance
with its output open.
3. Get the parallel equalivent circuit, which an 8753B network
analyzer will do automatically.
4. The parallel resistance is then the total power burning element of
the insides of the tuner.
5. Reinstall the tuner, turn up the transmitter to full output and
measure the RF voltage at the input connector of the tuner with a T
connector or something.
6. Then, for that operating point, or match, the power disipated inside
the tuner box is V^2/Rmeasured.

Since the measured R is dependent on the Q's of the components inside the
box it should be differnent for each matching situation and hence the
power disipated will be different each time. I have not tried this,
maybe the value of R is often to far away from 50 ohms that the
inaccuracies of a directional coupler type of network measurement
instrument like the 8753B lead to big errors. Or, the measurement could
be made on a bridge. I have measured Q's of 200 to 350 on large coils
used for matching in a 10 kw commercial rig. Coils have to get pretty
big to be efficient, silver plated and everything. I have not measured
any air variable caps, but vacuum variables are used for a reason.

Hank, a few years ago I compiled a fairly extensive article describing various modifications for the NRD-525. It was published in the 1991 edition of "Proceedings" (Fine Tuning Special Publications, of which I am an editor). The article is entitled "Improving A Winner: Modifications and Upgrades for the JRC NRD-525".

Each edition of Proceedings has many equipment reviews, antenna & radio/historical articles, construction projects, etc. for the advanced SWBC and MW DXer as well as AROs. If you wish info on purchasing the 200-pg. Proceedings from 1991, you may contact:

Fine Tuning Special Publications
c/o John Bryant
RRT #5, Box 14
Stillwater, OK 74074

Virtually everyone who has bought a Proceedings since 1988 commented that it was one of the best investments in their radio hobby they have ever made.

From my "BUYING A USED SCANNER RADIO" FAQ:

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor
receiver, you will probably want to buy more crystals to
cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack
store or from one of the companies below. Be sure to
specify the operating frequency you want and the brand and
model of scanner.

Some companies may ask you to send a schematic of the
scanner or require more detailed information, like series
or parallel resonance, load capacitance, etc.

You might try adapting an aviation ADF (Automatic Direction Finder) to marine use. Older units such as the Bendix T-12C (analog dial) and T-12D (digital frequency select) work quite well and are commonly found in the $350 to $750 range, there are many others just as good. As a bonus they work on 12 volts. It does take some skill to install them correctly. Non-metal boats will require some ground screen under the "loop" antenna.

It's been a long time since I had one of these radios, but I'm pretty sure that Yaesu made an optional ctcss (pl) tone module that simply plugged in inside the rig. PL was then programmable from the keypad. If my memory serves me correctly, you had to remove the battery, then 4 screws from the bottom of the radio. This gave you access to the tone board connector. You will, of course, have to scout up a tone board. I'd suggest that you try calling Yaesu, as they may still be able to provide this item. Good luck, it was a pretty good rig!

PLEASE-Reply to me e-mail, not by posting to this group, as all it does is create excess traffic. Thanks.

2827. QRO HF-2000 HF linear amp owner's comments

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-26 00:00:00 UTC
From: jchol@aol.com
Message-ID: <4grm2j$gcf@newsbf02.news.aol.com>
Source record: 205121

I have seen several questions about HF amps: What is the best tube? How do the Heathkits compare, etc. That motivated me to share my experience.

I have constructed both the SB-200 and 220, owned an SB-1000, owned a Henry 3KD Premier, and now own a Dentron MLA-2500 and the QRO HF-2000. I like all the amps mentioned for different reasons; but for my taste and operating habits, the QRO stands out from the crowd:

1. Very quiet and effective fan - quietest I have ever heard.
2. QSK with vacuum relay very good and very quiet!
3. 3-500z tubes are the best value and are mistake tolerant. Most tubes are blown by operator error such as wrong band or antenna connected.
4. I find the tuning very smooth and reproducible.
5. Very good on the air reports.

The Henry amps are very well built, but most don't have 160 which is my primary band of operation. The 3KD Premier does have 160, but the blower in mine was too loud for normal conversation. The Heathkits are excellent value, but lack 160 also. I like the size of the MLA 2500 - a lot of power for the size.

Of course there are the alphas - I have two friends who own the manual tune 89, I think. They are excellent amps, but the cost of the tubes is high.

I'm not much of one to recommend since individual preferences and pocketbooks differ. But if you have been thinking about a new amp, take a look at the QRO.

2828. Re: Microwave Modules 50MHz converter-help!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-26 00:00:00 UTC
From: Al Bolton <Al@boltons.demon.co.uk>
Message-ID: <825322329snz@boltons.demon.co.uk>
Source record: 205122

Hi,

I have just been given the remains of a Microwave Modules 50MHz converter (with a 28MHz IF) and I would like to "restore" it to life.

Only trouble is, it is missing a few components. The previous "owner" either stripped it or his dog ate it!

One missing component is obviously a semiconductor, with 4 legs. Judging by the circuit that remains this was probably a 40673 as these were frequently used in these type of circuits. An inductor is missing as well-although the loops of wire are still there! This is 4mm wide by about 15mm long, with an iron core.

Does anyone have a circuit diagram for this converter? I would be very happy to pay for a photocopy or a fax of it.

Is there an equivalent for the 40673 readily available as I have been unable to obtain one (must be years out of production I suppose) ? My local Electronic stores certainly don't list it either, nor the small inductor. Any help here gratefully received.

Many thanks,

Al Bolton.

2833. Icom 730 - rx problems

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-26 00:00:00 UTC
From: jwg6@cornell.edu
Message-ID: <jwg6-2602960742530001@cu-dialup-0915.cit.cornell.edu>
Source record: 205127

I'm using a borrowed IC730 and theres something odd about the receiver. Signals barely move the S meter and I have to have the "preamp" on all the time to make the rx sound normal at all. Even then, really strong signals only get up to S5 or S6. It's particularly noticeable on bands higher in freq than 40 meters.

Transmitter is fine, does well. But received signals sound somewhat "clipped" or filtered. It's rather annoying. The rx should work well without the preamp. I can't find any attenuator switch anywhere, and RF gain is always at max. (I don't have the manual, by the way.)

Anyone had this trouble? Where might I start trouble-shooting? Someone suggested the tx/rx relay might be bad...

The owner inherited the rig from his deceased grandfather, but is still working on his ticket. It would be nice to have the rig operating correctly by the time he wants to get on the air. Thanks alot N1AEP

I've owned a DJ-160 for about 4 years now and the radio is a real workhorse. It has 20 memories, VFO, tone encoder, autodial capability and other features. It has plenty of audio output, something most HT's need more of. The only negative is the fitup of battery pack to the radio, it tends to loosen up with age. Mine was remedied by adding a generous amount of "Shoe-Goo" on top of the pack.

>least 6 times to clean them out, since it's really a pain in the butt
>to remove the entire board and go through the desoldering of about
>250 components.

As someone who works in electronics repair, I see this stuff all the
time. No manufacturer I've encountered is not guilty of using the stuff!
I see it in VCR's, receivers, cassette decks, CD players, etc etc. They
usually use it to glue down capacitors for some reason but some dummies
even dribble the stuff all over 64-pin surface-mount microprocessors!
(BIG MISTAKE!)

It can usually be softened up a bit with lacquer thinner (DO THIS IN A
VENTILATED AREA!)

>
>Unless you're going mobile, skip the HOT GLUE. A) it's a lousy thermal
>conductor, B) it doesn't like heat and C) try to get that out later!

Another 2c here. I have the same problem with my TS430. It just stops
working above 14MHz. The problem is in a 4 pin flat connector on the

side of on of the boards. The connector has the control voltages activating the bands. The first time it happened I just unplugged and replugged the connector and it was OK. The next time it happened, a year later, I had to reconstruct the whole problem again and this time I marked the connector. It still happens now, but I can thump the rig and it comes back.

>mixer I think...
>
>73 from SM7KWY - Lennart

Yes, what you want is a converter. You want to kick the VLF up to a much higher frequency, however, usually up around 3 or 4 MHz. This makes image filtering much easier. The converter would consist of an antenna matching network, low pass filter, mixer, local oscillator, and a post mixer amplifier. Perhaps the best "antenna matching network" is a FET used in an emitter follower configuration. The very high gate impedance serves to match the very high impedance presented by the typical short (in terms of wavelength) VLF antenna. Follow that with a Pi low pass filter designed to match the input impedance of your mixer. The local oscillator would be a simple crystal oscillator operating in the 3-4 MHz range. The post amp would match the mixer output impedance and deliver the signal to the receiver.

The area around 0 Hz will be "masked" by LO leakage when using a converter. The range from 0 Hz to 3 kHz may be better monitored with a simple high gain audio amplifier (and a power line frequency notch filter). A phono preamp for magnetic cartridges is a good receiver for this ELF range. The frequencies are low enough you can hear them directly by ear without conversion.

Jim,

I think that you have offered the most common sense approach to this issue. However, is it even necessary to use a nonreactive load approximating the impedance of an intended antenna? Why not just use the intended antenna as the load and measure the RF voltage and current at the input and output of the tuner - period?
Maybe I am overlooking something and the issue is not as simple as this?

I had a similar problem with my TS-680 and the KAM. The hum and
garbaged audio did not occur when using the original hand mic bud did
occur with most others including other Kenwood mics. I think part of
the problem I found was that I shared common between the audio and PTT
lines when connecting the Kam to the ACC2 connector. Most modern mics
use electret elements which require a low level of DC to work. I
surmised that this DC was getting into the radio's audio via shield.
This seemed to work and bypassing is also recommended.

The LK500 had some 'updates' (read 'fixes for defects') and went through some trying times. The basic unit started a about $1,095, and I recall the No Tune option rang the register at about $1,395 - then the revised issue went up around $1,595.

the Amp Supply Co, (later known as Amp Int'l) was the rebound firm of Denny Hadd, after he went bankrupt with Dentron. BTW, parts and service are still available via Bill Edwards, ex-Amp Supply employee in North Carolina. I've had a few, still have a 500ZC sitting on the shelf. If you understand the holes in these boxes (& keep spare parts handy) they aren't a bad basic amp.

Good Luck with your prize ; ')

It's not obvious to me how this would work. Wouldn't we have to know the
phase angle between the voltage and current to determine the power?

>EI7EEB

I have had the same problem with my TS-440. No Audio and the row of dots indicates one of the PLL's is dropping out of lock.

The first time it occured with me I sent the rig to Kenwood for repair. The rig was returned and a dry joint on the PLL board was the problem.

Most recently the problem occured again on the 14.5-22 Mhz VCO. This time it was a leaky electrolytic capacitor on the PLL board.

The 440 is known for developing unstable VCO's. Unfortunately the problem is not confined to one component. The best advice I can offer is to get hold of a service manual and carefully measure the voltage values etc that it describes for each VCO on the PLL board. If you can narrow the problem down to a few components it is pretty easy to test each of these. Be warned though, the service manual I have is full of errors and made the investigation process longer than it should have been.

First thing I would look for is a dry joint. The solder job on my PLL board was terrible. At least the PLL board comes out of the rig easily despite the myriad of cable connections (they only reconnect the one way so dont be daunted by their complex appearance).

Good Luck

Brian VK1BF

2856. Heath SM-150A manual/schematic wanted

Newsgroup: rec.radio.amateur.equipment

Hi Rich,
Get to a hamfest and find a couple of used BNC inline 10 and 20db instrument
grade attenuators as made by HP, Texcel, and Weinschel(?). $10 ought to buy
a couple of them. These are FIXED, but they are rugged, reliable and easy to
swap in and out. You can get them with type N connectors too but it sounds
like you want BNC.

2865. Key jack placement...

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-26 00:00:00 UTC
From: yee@mipg.upenn.edu
Message-ID: <YEE.96Feb26175915@picard.mipg.upenn.edu>
Source record: 205159

I note that the key jack on many if not most commercial HF rigs is on the back of the rig. The phone and the mike jacks are on the front. In my musings, it occurs to me as if user controls/connections belong on the front of the rig. Controls and jacks that are for rig setup and adjustment should be in the back. By this reasoning, the key jack should be in front. From the point of view of the manufacturer, is CW such a un-used mode that it is a good idea to relegate the jack to the back?

VERY well, I *WILL!* All the many "intellectual" posts on this issue have
YET to come up with even a GUESS as to power loss thru a tuner. Is it
5%, 10%, WHAT?
Instead, there are an abundance of THEORIES on POSSIBLE ways a person
might come up with a figure, and that's about it. If a person has a
serious mismatch in his feedline, greatly reducing his power output from
his rig, improving the match using a tuner will result in a happier rig,
greater output, and the resulting loss created by the tuner will be
rather inconsequential compared to the benefit provided. Assuming a
100 watt class rig, reduced to, say, 30 watts into a poor match,
which is then improved to 100 watts with the aid of a tuner, even if
the tuner introduced a 10% loss, it would STILL improve total output
by 60 watts, or about 4 db! This issue was not aimed at the obvious need
to design antenna systems to operate WITHOUT tuners, so no point in
fussing about THAT!
Lose sleep over the exact watts lost in providing a proper match to the
rig? Not me!

From: sba3020@InfoNET.st-johns.nf.ca
Message-ID: <4gu525$ais@coranto.ucs.mun.ca>
Source record: 205072

Wanted a frequency mod for the yaesu ft-726r all mode tribander.
Anyone else have this radio and can give me any opinions on using
it. I was told of a frequency mod for the 430 MHz band module
to operate on 440 MHz. Looked at the WWW mod sites and could not find
it. Anyone else hear of this mod? Also looking for the 50 MHz and
440 MHz band modules. Will the band modules from a FT-736R work
in the FT-726R?

If you know of the mod to use the FT-726R on 440 MHz using
the 430 MHz band module please post what site it's at or E-mail
me the details.

How would anyone compare the Ft-726R against the FT-736R besides
it having CAT and 1200 MHz band option?

> rig? Not me!

Your numbers make the argument look like trying to debate how many
angels will fit on the head of a pin. On the other hand, it is easy to fabricate
equally plausible numbers that don't make the debate look so trivial. The
real issue is getting an understanding of the problems, trade-offs, and
solutions involved. An informed decision in setting up a station is
far better than a guess based upon myth, folklore, or intuition.

Trivializing the issue is like hoping it will go away. It allows people to
sell antennas that have resistors in them because they provide a good
match. It allows others to look at the wattmeter in their tuner and
believe their rig is putting out 200 watts, when in fact it is only
100 watts. Does it matter whether a "guess" can be made or not?
That sounds to me like trying to guess whether all dipoles are good
antennas without knowing their construction, installation, orientation,
ground conditions, intended use, etc. If someone guessed and said
that a tuner loses 10%, would that be meaningful? Probably not as

some would likely lose 1% and others 90%.

Designing from ignorance is what lets people believe they have
a great antenna system because it covers all of 80 meters with
less than a 2:1 SWR. The fact that the Q of the antenna is so low
which is what is giving it the broadbanded behavior and that as
a result their radiated signal is nil, doesn't even come up without
some knowledge of how or why things are the way they are.
A dummy load provides a great match at a very wide range
of frequencies, but it doesn't make much of a radiator. ;-)

Feel free to ignore the issue. I don't believe anyone is losing
sleep over this, but that doesn't mean it is pointless to discuss.

73,
Todd

Richard,

It is easy to show that your method does not work:
Imagine someone had incorporated (without your knowledge) a resistor
in your tuner just before the output connector in series with the
coax inner, you would not detect its losses, because it carries no current
when the output is open circuit.

The way around is to measure all four scattering parameters, if you want a
result more accurate than what can be got from a reflectometer.

Dear all,

Has anybody know/used the Nevada TM1000 ATU?
If so,can you let me know some details?
In particular: 1. General performance
2. Real power handling!
3. Componets used (is it a T-network? does it use a roller
coaster?)
Thanx in advance, I look forward to some replies.

Please reply to pma@doc.ic.ac.uk

Thanx,

Paris 5B4XF / G0WUT

Dave - all I have seen recently is lengthy editorials as to why out-of-band mods should not appear here. Since I just bought a 706 I am searching for these mods and would appreciate copies if you kept files. Out-of-band mods are not of particular interest so the ethicists can relax.

Thanks.

> instead of black).
> --
> Tom Leber N3QKV <leber@voicenet.com> - Wyndmoor, PA USA
> "Smother technology and it rebels." - Max Headroom
>

Plantronics headsets have "simulated carbon" mikes, i.e., they use a dynamic mike with a preamp which is powered by microphone bias current from the transmitter. Starsets (tm) will work with most h-t's without modification other than adding the necessary connectors, and a push-to-talk switch in series with the mike preamp leads if there is none already. Polarity is unimportant: they are designed to work with telephone equipment, and contain current-steering diodes.

Most are supplied with long, unshielded curly cords with dual 1/4" phone plugs at the end. The tips are the mike circuit, the sleeves are the earphone. You may want to replace the long cord with a multiconductor shielded cable to prevent rf feedback.

If you are right-handed, wear the headset on the left or else you'll forget it's there, try to eat something, and bite the tip of the voice tube.

The end of the voice tube should be located at the corner of your mouth, not in front of the lips, else there will be unpleasant puffing sounds in your transmitted audio.

From: emichelson@nwu.edu
Message-ID: <4gvb7r$54a@news.acns.nwu.edu>
Source record: 205088

I am interested in learning more about inexpensive demodulators for converting FSK, RTTY, WEFAX, ACARS, etc. I understand there are inexpensive units that take a line audio output from my SW rig to a demodulator then to a PC to read the output.

One person reccomended a Microteck device for $99.00. DOes anyone have experience with this or other such devices? Also, how hard would it be to build one? Are there kits or plans published for doing this?

I have a SONY SW100S receiver and also a HP100 LX palmtop. Would be interesting to use a small demodulator to read CW, RTTY etc on the palmtop.

>Roy Lewallen, W7EL

Yeah, we do. We need another bit of information to get that don't
we? If we knew the terminating load impedance, we'd be home free,
but we don't know that. We discovered the voltage peak with the RF
voltmeter, but we need to find the current peak too. Then the phase
angle can be determined by the length of line between the two peaks.
Looks like we need a current probe, can be relative, that we can
move along the line too. That could be as simple as a NE-2 and
a small loop, mounted on a wooden stick we could move along the
line. Or we could get fancy and use a split ferrite, a diode,
and a meter.

Hi Gary, if well designed *balanced* tuners were readily available, this thread would probably be moot. How many hams do you think use the following configuration?

Xmtr---unbalanced----balun----ladder-line----non-resonant length
tuner balanced antenna

This is the configuration some of us are worried about. IMO the tuner function should be moved to the ladder-line side of the balun implying balanced tuning techniques including balanced tuners, stubs, and/or parallel or series reactances.

: Roy Lewallen, W7EL

Hmm, well, if he could slide the ammeters AND the voltmeter along the line and find the positions of the respective maxima, and know the length to the load end as well, he can get the velocity factor from the distance between current and voltage maxima, then get the reflection phase shift from the distance between a maximimum and the end.

It could be done, but I can't imagine anyone would want to do it this way.

I think I'd build myself a vector voltmeter before I got desperate enough to use lecher lines on a regular basis

Cheers
David

The local server recently changed its DNS number. Some people have
complained they can't access my pages any more.

You should be able to find them under:

http://www.innotts.co.uk/~asperges/

but if not, instead try:

http://194.176.128.13/~asperges/

and it should work. This is the new DNS address.

The pages contain info of interest to Radio Amateurs, Radio
enthusiasts and Short Wave listeners.

* There are links to many other pages, newsgroups, ftp etc;
* A mock exam;
* Questions and Answers for newcomers;
* IRC links
* Links to Friends on the Net (mostly homepages involved in radio)
* The new Short Wave Listener pages with links to Broadcasters on the
Net.
* The Russian link;
* Sources for help;

There will be new updates in March.

Also, you might check with LF Engineering: 17 Jeffry Road, East Haven, CT.06513 (203-248.8851). Their 1996 catalog includes some prebuilt stuff, e.g. L-202pcb preamp, $45. Postpaid in US, "28db amp/filter... sharp 530KHz rolloff for 1-530KHz reception...." (case extra), and L-111/PCB converter circuit board for $69. PP in US/Canada with "low impedance... dynamic range (120db typical) balanced mixer, with RF, IF, and local osc. filtering.... (for) reception below 10KHz and sharp roll-off filter (to) eliminate BC intermod...." They also sell the simpler but fun audio receivers for 'baseband' reception: e.g: L600s H-Field Loop Receiving System "directional loop design... with... sharp filtering... " Broadband/Hipass 60Hz cut filter, 63 db amp, 8KHz lowpass, 24" sq. directional loop @ 7KHz low-Q resonance, 300Hz-8KHz passband with filters. $139 PP in N. America. And LFCAD software: 40-something programs for antennas, filters, resonance conversions(?), etc. $19.
There is also the Longwave Radio Club of North America, c/o Bill Oliver, 45 Wildflower Road, Levittown, Pa, 19057. BTW, LF Engineering has an Email: 76715.2361@compuserve.com. 73, K9ZAT.

Cecil, I think the more common scenario is someone using a 100 watt class rig into a coax fed antenna of some sort, a diplole or beam, which is significantly off resonance on the band or frequency of the user. More like a dipole cut for the CW portion of 80 meters, and trying to load it up high in the phone band with the resulting 3 to 1, or higher, SWR. A decent tuner is capable of matching this load, and greatly increasing the power output of the transmitter, tho obviously the antenna itself is no better a radiator, or more efficient just because the transmitter "sees" a better match. While I personally feel this is a "standard" scenario, I have no better idea of what sort of setup the original poster had in mind than anyone else responding to the question - so why attempt to "make up" all sorts of difficult scenarios, complete with correspondingly complex ways to check out power loss, when it may simply be stated for the one ASKING the question "power loss thru a reasonably designed tuner, properly adjusted, will range from 5 to 15 percent, depending on antenna and feedline type"

Again, what's so hard about that? Why bury the poor guy with complex solutions to a simple question?

Well, I'm not sure I would say "most Motorolas are PM". Any Motorola
which can be equipped with DPL is almost certainly already direct-FM
capable (DPL == digital private line, very low frequency data, requires
DC response). Most Micor VHF mobiles are PM, the UHF mobiles are FM,
Mitrek and Maxar are FM. Micor repeaters are usually FM.

>>Specifically, you will need to "break in" to the channel elements

You're better off finding one of the 4 pin Micor channel elements and
wiring up the modulation pin than tinkering with a 3 pin channel element.
Try asking Brian Kantor about this...

> Maxtrac and Radius are synthesized radios. There is no "channel element".
>I do plan on researching putting these radios onto 9600 baud sometime maybe

>I can retype these sheets and post to this group.

If you try to modify one of the synthesized radios, look for a jumper on the board to enable modulation of the PLL reference oscillator. The synthesized MCX100s offer this, for example.

: Roy Lewallen, W7EL

Gary will probably answer this with his own reasoning, but I think he
gave enough information if you know the characteristic impedance of
your line (and it is real). If my quick calculation is correct, I get

Pout = (|V|^2/Z0 + |I|^2*Z0)* (s/(1+s^2))

where |V| is the voltage magnitude and |I| is the current magnitude,
and Z0 is the real characteristic impedance, and s is the swr.

I just calculated the sum of the forward and reflected powers:
PF + PR = .5* (|V|^2/Z0 + |I|^2*Z0)
from
V = VF+VR
I = VF/Z0 -VR/Z0
where VF and VR are the forward and reflected voltages. Substituting
into the right side of the first expression gives
VF**2/Z0 + VR**2/Z0 = PF + PR.

The SWR gives the ratio
PR/PF = ((s-1)/(s+1))**2
and you then can solve for PF and PR, and Pout = PF - PR.

Hi there. The Decameter radio bursts do not stay on a particular frequency. They are quite broad banded and move in frequency as time goes on. 22 Mhz is a good place to look, but it also has some broadcast stations on when the ionosphere is refractive to those freqencies. It is best heard on a broad band AM shortwave receiver with a directional antenna (like a Yagi or a loop) pointed at Jupiter. The emissions are very irregular, and seem to be most often observed when the moon IO is in certain positions around the planet.

SIGHHH - AGAIN, *OBVIOUSLY*, but that was NOT the question, and may not be practical for ALL situations. Some folks using tuners are operating from restricted locations such as apartments. Telling these folks they should be using a resonant dipole or beam 80 ft. in the air may be TRUE, but for them, totally impossible!

Stick to the subject!

: but for them, totally impossible!

May be but there are thousands of hams out there that have been led to believe that using a tuner and open wire feeders is more efficient. Over the years there have been many QST articles, especially back in the 70's, written by Lew Mccoy and others which claimed great and mighty things for tuners. Never was there any mention of loss in the tuner! I personally know several hams who swear that because they use open line and a tuner their signals are superior and they scoff at anyone using coax.

One fellow I know has plenty of space for resonant dipole. Instead, he snakes the ladder line up the side of his house, across a gutter then up the tower to his CF zepp. Using a $2000+, new solid state rig, he carefully adjust his tuner for a dip in the swr, meantime causing qrm while tweeking the thing up. He brags; NO COAX HERE OM!

The problem with that, David, is that the vector voltmeter would need resolution even better than that required to use the Bird we were originally discussing, IE too many significant figures, at the extreme load impedances Roy was suggesting. That would cost big bucks, if it were practical to do at all. It seems better to me to take advantage of the characteristics of the existing feedline to yield the information needed without resorting to elaborate or expensive measuring equipment.

Tom,
I've used several of these units for radio mics. The only problem
I've experienced is that they tend to be very RF sensitive. There is
typically NO bypassing or filtering on the mic preamp and the 3 - 4
ft. cord acts as an excellent antenna!

The ones I used had the preamp in a tan box which formed the back of
the double 1/4" phone plug. It consisted of a single IC with a few
passive components. If you experience RF getting back into the mic
audio, you can first try to bypass the leads going to the earset cord
and to the plugs with ferrite beads for the appropriate frequency and
possibly lining the inside of the case with copper foil tape and
soldering it to the radio chassis ground lead. If this doesn't do it,
then you'll have to gut the mfgr's supplied preamp board and build up
one using a single transistor amplifier using proper RF suppression
techniques. (beads, shortest possible leads, etc.) If you still have
a problem, e-mail me and I'll try to make an 'ascii pic' of a
schematic I've used many times with great success.

>Has anyone got a TS-870 or FT-1000MP?

I recently upgraded from a FT-1000D to the new "MP" model. I thought the receiver on the "D" would be tough to improve, but it's quieter and more selective.

The MP really shines on both CW and SSB transmit. I always felt that the FT-1000D was not up to par with other transceivers in this area, but now the CW QSK is almost as good as my Omni Six. The SSB audio can be tailored with three separate DSP menu areas for a total of something like ten different EQ patterns in all; actually more when you consider the different possible combinations.

I suspect that QST will have the FT-1000MP's product review in their next issue. You may want to wait and compare notes with the TS-870.

2936. HELP! with TS-520S cw receive

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-29 00:00:00 UTC
From: jlynn@pennet.net
Message-ID: <4h5046$pcp@crash.microserve.net>
Source record: 204960
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Please, I need help.

I have a Kenwood TS-520S that has a problem with receive in the CW mode. When receiving in the CW mode, I can hear a station, and if I tune up the band, I hear the same station 2 KHz up frequency, from center to center. From the edges of the signals, the distance apart is 1 KHz. The higher frequency is the true operating frequency, and the lower frequency is a "ghost" signal. The "ghost" frequency is just as strong as the true frequency. The way this sounds is very similar to the 25 KHz calibrator marker signal. Sideband receives fine, no "ghost" signals.

I have gone through the manual, but nothing seemed to stick out as helpful. I don't want to send the rig away to have it fixed if it is something simple to fix, like turning a screw.

CW is my favorite mode, and with all the extra signals, the QRM is outrageous, and the QRM is nothing but "ghost" signals.

Any comments, hints, or solutions on how to remedy this problem will be most welcomed.

e-mail: jlynn@pennet.net

Thanks and 73's

> Or are you *STILL* standing there puzzled by "regular, or decaf?"...

Well, given that I rarely drink decaf, I don't believe I am "standing
there puzzled...". I don't recall the originator of this thread giving
enough information to make a reasonable guess. If the tuner is
using a coil wound with 40 gauge nichrome wire and really lossy
capacitors, any estimate based upon a reasonable design would be
meaningless.

Personally, I'd rather operate into a resonant antenna that provided
a reasonable match to begin with. Lacking that, I'd try to understand
the load I was trying to match and work to convert it into a load my
transmitter could handle. Both require knowledge instead of
ignorance. That was the only point of my post, i.e., a debate that
uncovers the issues to be considered is a worthwhile debate.
Ignoring the issues to be considered accomplishes nothing.

>> Anyone have an idea about a less expensive alternative?

XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX

Try this too:

Contact your local Motorola Dealer! They have a publication that outlines solutions for mobile noise. I'm sure that they would be happy to provide you with a copy without charge. I got mine that way.

I looked for my copy to pass along the official publication number, but I was unable to find it. All of Motorola's service techs. should be familiar with the book... it's about 50 pages or so with great descriptions and help in localizing the specific noise source(s) and methods to eliminate same.

One of the tips was to use 'airport approved' plug wires. Delco, I think... Do get the publication. I think it will be a great help.

I think that by now, faced with all the proposed work to "measure and
evaluate tuner losses" to feed my miserable random length end fed wire,
and the expense of all those wattmeters, RF meters, Bridges and duplicate
tuners, I would just sell my radios, and take up stamp collecting - it's
FAR less stressful...

From: kb2rmi@pop3.frontiernet.com
Message-ID: <4h4uef$qb0@cheatum.frontiernet.net>
Source record: 205047

I have an unmodified 2510, it has beaucoup TX output but no modulation, I want to start with something simple like the possibility of an NG mike element, but am open to suggestions if this isn't the case. Wondering if this is a common problem and there are a lot of 2510 experimenters out there, hopefully one can get me some ideas as opposed to trying to debug it w/o schematics. Also, I am without a manual so I would appreciate any help in finding the mike pinout as well as the accy. plug pinout. The rig is about mint cond, and was never used for voice communication. Also understand that there are a lot of mods available for these, any thing about these would be appreciated as well. Please email responses, Bill KB2RMI

The only modification I did to my Ten Tec Scout was to move the ext.
speaker (which is a 1/4" phone jack, go figure) to the back, and the cw
(min phono jack) to the front.

Now not only do the plugs for my speaker (min phono) and key (1/4")
fit, the key is easy to plug in and remove. I still don't understand
the original design.

2954. Finnish Rep for the RA1AOM keys and paddles

Newsgroup: rec.radio.amateur.equipment
Date: 1996-02-29 00:00:00 UTC
From: Dave Heil <K8MN@clinet.fi>
Message-ID: <4h58fv$d13@news.clinet.fi>
Source record: 205051

Thanks to all who expressed interest in the keys made by Val RA1AOM in St. Petersburg, Russia

For those of you who missed the posting, the keys are high quality hand keys and paddles. The paddles are sit either on a stainless steel base or a green marble base and the mechanism is stainless steel and titanium. The fingerpieces I have are white teflon and have some nice "give" to them. I now understand that there is a slate colored fingerpiece option (no flex). The keys were being sold at the SRAL (Finnish League) convention in Kouvala over the 2/24 - 2/25 weekend.

The Finnish rep for the keys is:

Olavi Tupperainen OH6CT
Kulos Puistotie 42 B 31
00570 Helsinki
Finland

I'll try to get a phone number and/or internet address for Olavi and provide it here as soon as possible.

OH2KMF and I bought our keys at the convention. K3FK has his on order. I understand that Val sends the keys to Olavi on a regular basis.

Arno OH7XM and I modified my key slightly. Paddle resistance was a touch to much for my liking so we eased out the return spring and clipped two turns off the spring. This has a lot to do with individual preference so you may or may not choose to do the same.

I want to point out that I'm not in the key business. I would, however, be happy to collect e-mail messages from those of you who are seriously interested in obtaining the keys so that Olavi can mail you information. Please include your complete name, call and full mailing address in the body of the e-mail. I'll save these over the course of the next week or so and mail them at one time to OH6CT.

I am thinking about selling my old pk232 that has been upgraded to pactor for one of the new DSP232 units. Does anyone have any experience with the new AEA product? Also thinking about the PK900. Thanks for your input. Hank - K9LZJ

The FT-980 was the first Japanese HF all-mode, all-band transceiver with external PC control capability (the KWM-380 came out a little earlier). It is all solid-state, 100W output, with an internal, and somewhat underpowered series-regulator AC power supply to provide the required 12V DC. It was produced for several years beginning in early 1982.

I had one for years- little trouble, very flexible design.

Too bad. I don't know of any commercial units, but Far Circuits
sells a circuit board and instructions for constructing an active
attenuator that really works. It's actually a *converter*, shifting
the signal 100 kHz off to the side. You tune your HT to the
shifted frequency, thus avoiding any possibility of signal leakage
directly to the HT spoiling the effect of the attenuator, and control
the attenuation by varying the amount of LO injection to the mixer.
Really slick, and works very nicely for the part of the hunt where
you're closing on the fox.

The problem with ordinary attenuators when you get close is that
the signal will bypass the attenuator and go directly through the
case of the HT. By shifting the frequency, that can't happen because
the radio is no longer tuned to the fox's frequency.

>I am considering the 706 and would appreciate any feedback from hams who
>have experience with it. How is the selectivity, weak-signal response,
>etc?

See the review in the March QST. It's a good radio, a great radio considering its size and price. It offers good weak signal performance with the preamp on, but it will crunch under high signal levels unless you use the attenuator. So if you're trying to pull in a weak one right next to a very strong signal, you'll have some problems. There is also a bit of filter blow-by due to the nature of the design, but again it isn't a problem unless you're operating under the most demanding conditions. It's no IC-775 or FT-1000, but then it costs a *lot* less than either of them, and fits in a much tinier spot. Unless you do no CW or digital work, I'd strongly advise getting the optional 500 Hz filter, it works really well.

It's a wonderful mobile rig, very easy to fit into the tightest places, and has a control system that's a dream to use in a mobile environment. It does draw 2 amps on receive, so it is less than ideal for battery portable operation. To fully utilize its wide coverage VHF receiving capabilities, it needs a mod. There are two floating around. One is pretty easy, and at least lets you listen to National Weather, but doesn't give full capabilities out to the advertised 200 MHz. The other requires a bit of SMD wizardry, but fully opens the radio up on receive. Did I mention it has a wideband FM capability too? You can receive FM broadcast and VHF TV audio with it. The wideband IF (separate from the regular IF) has a much too wide filter, however, and you may get some bleed from strong signals on adjacent broadcast channels. That can be fixed, but again requires microsurgery.

It works fine on RTTY (has a special RTTY mode), and works fine for PACTOR and Clover too. It has a *slow* tuning mode that is a delight for digital operation, and a IF shift that really works right for digital operation. (You can use the 500 Hz filter for RTTY, it shifts it up to pass the correct tones when you switch to RTTY mode, and back down to pass CW in that mode, slick.) It's also fully computer controllable through the C-IV port. And it has not one but two different ways to interface to an external antenna tuner.

There's a published out of band transmit mod for HF, but none for VHF (that doesn't mean it's impossible to make it work out of band on VHF, just that it isn't a "snip the diode and reset" sort of thing

like the HF mod is). You get full receive coverage on HF without the HF transmit mod, so unless you're a MARS operator, it's fine as is out of the box. If you're a CAP operator and need out of band transmit on VHF, you may find that the necessary changes are too elaborate for your tastes.

One of the things that makes this radio so much fun is figuring out the mods to fix its (few) deficiencies. It's not a perfect radio out of the box, but there's an awful lot of potential hidden in there that you can ferret out.

R>Myself and 3 friends all ordered batteries from Periphex for IC-W2A Icom
>handhelds. All 3 cases broke around the mount within 2 months. Periphex
>refused to honor their "1 year warranty" and all 3 had to be tossed.

R>DO NOT BUY FROM PERIPHEX! You will regret it!

Sorry to hear that. I remember when Pheriphex first came on the scene.
They had the ICOM IC0 series clones and they were very good. Have many
still to this day and have rebuilt some after 5 years of excellent
service. These cases are held with screws and are just as good if not
better than the OEM versions from ICOM. Their prices are much more
competitive than ICOM's too. I have some clone batteries for the Yaesu
FT-73R and they're very good too. They can't be rebuilt though since
the case is welded together (taking it apart is very messy!)

Since I have not bought anything from them in the past year, I cannot
say that their quality has not gone down. But, up to a year ago, they
were still a great company.

BTW, what was the reasoning they gave you for not honoring their 1 year
warranty?

Ahem. The serial port at the mic connector is a bidirectional affair. You just need to send the commands the remote display mic sends and interpret the results. To clarify, some of the early yaesu serial interfaces were 'non-interactive', like the clone data transfer in an FT5200 mobile rig, while others have been interactive, like CAT, or the ft727r miniCAT. The FT530 and other radios which support things like the remote display microphone have 'interactive' serial ports, usable during normal operation of the radio. That is how the MH29A2B mic works, and is also how the 'windows control of ft51r' and ft8500 rigs work. It is also what makes the remote head of the ft5200 not require a huge cable: the control head talks to the deck through a bidirectional serial link (although the one on the mic pins is only usable when 'booted' in diagnostic or 'clone' mode, the other serial link is used while operating.)

2968. Mods/Comments for Yaesu FT-51R

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-01 00:00:00 UTC
From: lui@netcom.com
Message-ID: <lui-2802962016480001@192.0.2.1>
Source record: 204968

Does anyone who owns a FT-51R have any comments on the unit or the programming software? Does the unit truly only receive to 470MHz? The magic number for me is 471.1375MHz, the frequency of our local police, which I like to monitor.

Does anyone know of any mods for the FT-51R (preferably keyboard) to extend the RX range? The unit is so small that I would think any hardware mods would be difficult.

Stephen

It would thus seem important to guard against someone sneaking around
and soldering resistors into your antenna tuner without your knowledge.

The real part of the load impedance represents, unsurprisingly, dissipation
in the load, not in the tuner. Tuner dissipation depends solely on the
internal real resistances parasitic to its construction, and upon the
circulating currents and voltages due to the imaginary component of the
transformation impedances. While the imaginary components depend on the
load impedance, the parasitic real resistances in the tuner do not, and
are a function of the unloaded Q of the components used.

Money!

Do I need a license ?

Not to buy, but you need a license to operate an amateur *transmitter*. You don't need a license to operate a receiver in the US. There may be restrictions on use of a scanner capable of receiving police transmissions in a vehicle in some States, however.

>And If I have a Call Sign here in Thailand and wanna get a US's Call sign,
>do I need to have a test? or just transfer.

I don't *think* there's a reciprocal agreement between the US and Thailand, but check with the ARRL to make sure. You can take a US amateur test and be granted a US amateur license as long as you are not an agent of a foreign power, IE not employed by and directly acting for a foreign government.

AFAIK the problem with the RS HTs is due to a harmonic of the Touchtone
pad tone generator oscillator. A harmonic falls on 146.76 MHz. If that's
your problem, you can try improving the shielding and bypassing of the
TT pad oscillator. Some RS HTs are worse than others, but this is a generic
problem, and not just limited to RS HTs.

Gerhardt G. Herbst II, is the patent holder for "Cold Spot Module".
This product is for sale to an individual or manufacturer.

The "Cold Spot Module" is used to effectively reduce the operating
temperature of integrated circuits such as computer CPUs to maintain
reliability under extreme operating conditions. This module is protected
under a U.S. Utility Patent issued in October of 1995. A Utility patent
provides the strongest protection under U.S. law.

An independent North American Market Study was done on the product and the
potential market has been identified.

The product has not yet been introduced to the general public but is referenced
in the U.S. Patent catalog which is posted periodically. For an on-line reference
refer to:

http://www.uspto.gov

Search on Patent Number: 5457342

The title abstract is: Integrated circuit cooling apparatus

Note: A search on just the patent number will bring up the details.

Exclusive rights can be purchased reasonably with negotiable license term.

For further information, contact Gerhardt G. Herbst II.

KJI Electronics 201 239-4389
Gene K2KJI

I have bought a lot of stuff from Gene. My TS-940 and IC-706 are two of the biggies. I've always been satisfied with his prices and service.

I can't post a disclaimer that I am not affiliated with Gene as I have helped in his booth at Dayton in past years. BTW he usually has VERY good prices at Dayton.

>me the details.

>How would anyone compare the Ft-726R against the FT-736R besides
>it having CAT and 1200 MHz band option?

Here in Chicago i find the 726 with its narower front end modules to be a
better bet than the 736. The 736 gets blown away with intermod and overload
while the older 726 works quite well.
If you are looking for a "wide band reciever" you will be better off with a
scanner the 726 does not go out of band well at all. the 430 to 440 conversion
should not be real difficult but be prepared to change a bunch of parts in
the reciever . I am told the "sat." board is no longer available. Good luck

>hundred and make out really good!

I saw one just a few months ago (in working condition) at a Ham Fest.

Unfortunately, the owner wanted $60, and I was unwilling to part with
that type of $$ for an amusing piece of antiquated technology. Also
it could RDF on FM, up to, BUT NOT INCLUDING the 2 meter HAM band.
If it had, I probably woulda bought it. But of course, if it did RDF
on two meters it would have:

a) already been sold

b) priced much higher

c) not been for sale

d) all of the above

The cost of Doppler RDF units is dropping, though. I believe a
company called Agrelo Engineering is starting production of a DSP
doppler system for hams, with a base cost in the $250 to $300 range.
They are on the WEB, but their URL escapes me at this moment.

Jim-

The HTX-202 CPU clock crystal is 3.579545 MHz, which is the standard TV colorburst frequency. It was chosen so it could be used both as the CPU clock, and for the Touchtone generator. The 41st harmonic falls close to the output of a 146.76 MHz repeater. Is that the birdie you refer to? I doubt anything can be done to eliminate it, other than to move its frequency away from 146.76.

I recall that someone claimed to have had their radio replaced with one that didn't have the birdie. Perhaps there is a newer version of the HTX-202, that uses a different scheme, or has better internal shielding. You might get a Radio Shack clerk to let you check a new one from a recent shipment.

2989. ADMS-1 Software for FT-51R

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-01 00:00:00 UTC
From: lui@netcom.com
Message-ID: <lui-2902961132300001@192.0.2.1>
Source record: 204989

Will the ADMS-1 software allow you to load RX frequencies greater than 470MHz into the FT-51R? I've been researching this lately because I want to monitor the local police, who are at 471.1375 MHz and most HT's don't receive that high unmodified. Is this as simple as entering 471.1375 into one of the memory locations and then downloading the data?

My other alternative is the get an IC-W31A or IC-Z1A and do the keyboard mod. However, I really like the ability to program the FT-51R from my computer because I travel alot.

Jeff, it sounds to me like your rig has both the upper and lower sideband carrier oscillators turned on simultaneously. That's the only thing that comes to mind which could cause the sort of problem you've described.

I don't have any Kenwood gear so I can't provide any hardware troubleshooting tips. Hpoefully someone else will step forward with more details. Good luck.

2995. Some notes on the IC-T22 mod

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-01 00:00:00 UTC
From: curt@lamar.ColoState.EDU
Message-ID: <4h8kjf$693s@lamar.ColoState.EDU>
Source record: 204995

Greetings everyone,

I have a small observation to share to anyone owning an IC-T22.

There is an easy 'mod' for opening up the receiver. If one simply presses the # and B keys while turing it on, the receiving range seems to go from 10 to 999.9 MHz continously. However, as I was doing some curious scanning, I noticed that there are 2 sets of frequencies that are missing. These are 824 - 849 MHz and 869 - 894 MHz. *hmmm*

As an extra observation, I found an extra function in the SET MODEs mode. This function was labeled PL and it has three settings: 1, 10, and 100. In VFO mode, a person could type in the four rightmost digits of a frequency. Setting the PL function to 100, that person can now specify all six digits of a frequency. Seems great for saving wear and tear on the dial.

If anybody has more information on this little spunky radio, please share it. I'd like to hear from you.

My thanks goes to jmb@eden.com and david_edger@fforum.blkcat.com for providing me with the original 'mod'. 73.

Ten Tec is a good company, the last of the US Ham Gear Manufacturers.
They make everything (even the knobs) in their Sevierville, TN, plant
which is worth a visit if you're in the area. Their service department
is legendary, the standard by which others are compared.

The Omni is a fine rig, excellent on CW (maybe the best QSK of any
radio) and with wonderful audio (Ten Tec's founders came from the
Hi-Fi industry). It uses a vfo (provision for an external) with
receiver offset tuning, which means no phase noise but no memories
either. That sounds like a good price, if the radio is in good
shape.

2998. ICOM IC-706 Poor Mic Gain

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-01 00:00:00 UTC
From: Scott Gray <scotgray@spider.lloyd.com>
Message-ID: <3137E997.5135@spider.lloyd.com>
Source record: 204998

Have a nice new IC-706. Love it, but the Mic Gain is poor at best.
Suggested fixes by ICOM (changing R236 to 100K) increases the mic gain
ONLY... SSB /ALC levels remain unaffected and low for my preferences.
The ICOM mod gives you a TON of increased audio (you can hear the little
fan blowing in the background with the mic gain set at about 4-5), but
you get mic gain ONLY. I mean independent of output power on SSB. Yeah,
on my local receiver (R8) and on a IFR 1200 service monitor the result is
loud. But the power level (SSB) acts as if I set the mic gain way down to
a 1. ALC action doesn't exist until I crank it up to 7 to 8 level. By
that time the mic is sooo hot that it picks up a flea's fart! But still
weak on SSB output power (FM Fine). Using a Heil HC-5 or a Shure 444
(with a dc block cap of course) produces unuseable audio for SSB work.
ICOM can you help? Anybody else experience this?
HELP.

Staying on CW for now....(BTW: its a super CW rig, just add a filter
maybe a DSP-9 and WOW!)

>coax is loaded and fed as 50 ohms and the loss of the tuner will be
>minimal.

That's how I feed my mobile antenna - with an SGC230 mounted at
the base of the antenna. It works great.

However, for fixed installations, I think you will find the
matched-line loss for reasonably priced coax is greater than
the total loss in the less expensive open-wire line even with
their sometimes "high" SWRs. The losses in the cheapest TV
twin-lead are approximately the same as RG-8.

Moving the tuner to the antenna may lessen or increase the
losses in the tuner. Varying the length of the transmission
line to reduce losses in the tuner is an option not available
directly at the antenna.

Cross-posted to: rec.radio.amateur.equipment,alt.radio.swap

I have a modified (extended band range) Kenwood TM-741A. I have the 28MHz, 144MHz, & 440MHz band units installed. The output power is 50W for the 28 & 144, and 35W for the 440. I would like to boost the output power to around 100W for each... (although I could live with less on the 440.). Please ignore my lack of knowledge in this area. Also, please post replies here as I am going to change my ISP soon. tia.

This set is most likely the SX-16 or SX-17 Super Skyrider, circa 1939.
I'm working on a SX-17 now - it's a super radio, just like it says! A
cabinet was made for the set, as I have one with mine, but a cabinet
for most of the Hallicrafters models of that year will fit.

I would value this radio, with cabinet, at $125 to $175, depending
upon condition and the desire of the buyer.

Enjoy the Super Skyrider.

I am narrowing down my list of 2M handheld radios that I want to buy -- I wouldn't mind having some opinions
on either one of the two radios in the subject of the posting. Pros or cons on either one of them. I kind
of like the removable control panel on the Icom, but other than that, am probably just going to flip a coin,
if I don't get any negative comments on either one.

Thanks for any information given.

John Timmers VE7 JBT (just got that ID today, BTW; I wrote and [quite obviously] passed my basic
qualification two weeks ago :-) [gotta' reward myself with a new radio ;-)

Wow! I bought the same battery for the same radio and had the same thing happen within a month or two!!!! I'm glad I read this post as I was about to order another battery from those rip-offs!!! They told me mine was the only case they had heard of with this problem and I must have banged the case causing the damage, I knew that wasn't the case. I was sliding the battery off the radio and the track on the battery just fell off, I assumed it was a defect in the housing case and now I know I was right. I'll look eleswhere for now on for replacement batteries. Periphex is off my recommended list.

-> I've had this old Hallicrafters receiver for about 20 years; I've used
-> it a lot for shortwave listening - it's still a great receiver - I'm
-> just wondering when it was made and if it has any collector value or if
-> it's just a neat old radio. Description:
->
-> Very large, rack mount, facepiece is 9 inches high by 19 inches wide.
->
-> No cabinet, don't know if it ever had one.
->
-> No model number I can find, but says "Super Skyrider" on the tuning
-> dial. The tuning dial is a 5 inch diameter metal (aluminum?) disk
-> sitting out in front of the facepiece, with freqs. etched in it -
->
-> Radio tunes from 550 KHz to 61 MHz in 6 bands (61 MHZ? why?)
->
-> Has standard meter and controls, including crystal phasing, pitch
-> control, bfo, etc.
->
-> Knobs appear to be black bakelite.
->
-> Any info. would be appreciated. Thanks in advance.

One of my books lists the *Super Skyrider* as being the model SX-9, made in 1936. Hallicrafters ham gear usually came in metal cabinets, somewhere along the line yours has had its cabinet removed for whatever reason. This was intended to be a ham communications reciever, so it goes up to unusually high frequencies. As for collector value, not much in the way of monetary value. But Hallicrafters radios were very well made and are still great for DXing-my first shortwave reciever was a 1946 S-40 given to me when I was a kid by an old ham who didn't need it anymore, and I still use it.

Source record: 204874

I've got a Kenwood TM241A that I've had for about a month. It seems to work
fine, except that the antenna connection seems to "ground out", or hinder any
signals when I connect the shield of the coax to it. Is anyone out there having
this problem, or do you know how to fix it? I've had no luck with the folks
at Kenwood, and I've done several tests to confirm that the problem isn't
in my antennas or cables. It's on the rig itself. I don't know much about
newsgroups, as this is my first indeavor into them, so I will not go into
details as to my efforts and ideas. If someone can help me, send me some mail
and I'll get back to you within a week. I'm on spring break from college now,
so I don't know exactly when I might get back on. Thanks a bunch,
and 73 to all.

Wilson WAS part of Regency (now RELM) but I think they were sold to TriElectric
You might get some info on the rptrs from either RELM or TriElectric..
RELM can be reached at 317-545-4281
Dont have a current number or address for TriElectric....not sure if they go by that name anymore.....
BUT IM sure someone here will be able to help.....or at least RELM/Regency
can point you in the right direction!

3017. Yaesu MD-1 Question

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-02 00:00:00 UTC
From: mbrinkho@falcon.inetnebr.com
Message-ID: <4haafp$5a9@duck.inetnebr.com>
Source record: 204876

I recently purchased a used Yaesu MD-1 at a hamfest. It seems the audio is a bit low on the mic - unless I talk about 1/2-1" away from the mic it barely moves the power out meter.

I have previously used the HM-1 hand mic and a preamplified (turner) mic with the rig, both of which produced quite a bit of movement on the meter when I was speaking (SSB, of course.)

The rig is a FT767GX.

Is this normal for a MD-1, or is there something wrong? (Before you ask, the switch is in the 600 ohm position.)

Thanks.

Mr (Ms) Ragdale. My July 1940 copy of "Radio" Magazine shows an ad for the "New" Hallicrafters Super Skyrider. It matches your description but six bands 540Kc to 43 Mc coverage. Two stages of preselection -- push-pull hi fi audio. Featured a Jensen speaker as an accessory. Price -- $159.50 with 14 tubes less speaker.

Send me an SASE and I will Xerox the ad for you.

Greetings,

I recently aquired a Pye Westminster transciever from a ARC rally, and I am looking for any info relating to it, especially circuit diagrams or pin outs for the many plugs.
All I know is that it transmits and recieves on two different, fixed frequencies around 170Mhz.

Any information would be much appreciated.

Please send info by email if possible, as the feed for this group is a bit slow here. (By all means send it to the group as well, if you feel it necessary.)

TIA

I don't know if this is possible with the FT-51R either with or without
ADMS-1. However, there is now an aftermarket alternative to ADMS-1. They
have a beta test offer out which discounts the product and provides free
upgrades. Don't have it yet, will be ordering it shortly. For info
check out the company's web page:

Collins Collectors Association
Frequently Asked Questions (FAQ)
(Updated 3/96)

What is the Collins Collectors Association?

The Collins Collectors Association (CCA) is a not for profit organization dedicated to supporting Amateur Radio operators who share the opinion that Collins Radio made the very finest amateur communications equipment available. The Associations root's can be traced back to February of 1988 when Bill Wheeler, KDEW organized a 20 meter NET made up of 17 like minded Collins users. That small group grew to over 1,200 by 1993.

The purpose of the Association is to:

-Promote the care and use of Collins Amateur Radio Equipment
-Preserve the history and lore of Collins Radio Equipment
-Provide an information archive for Collins Radio Equipment

What are the benefits of belonging to the CCA?

For the active Collins user, belonging to the CCA can be extremely beneficial. Our membership has a vast collection of printed matter relating to Collins Radio including both technical and promotional material. A simple verbal request on any one of our 3 nets for technical information or a service part can result in half a dozen or more offers of help. We also have an informal group of extremely capable
"Senior Technical Staff Advisors" who work on a volunteer basis to help members solve what can be complicated technical problems encountered in Collins amateur products.

An added benefit, members receive our quarterly newsletter, The Signal.
They also receive a handsome, numbered membership certificate suitable

for framing. The CCA offers other Collins related items available exclusively to members such as extremely high quality QSL cards, CCA name badges, tee shirts and other memorabilia.

Because the CCA stands for and promotes gentlemanly and amateur-like operation, there is a real opportunity to share in quality fellowship with other CCA members. You may even meet a few of our members who were employed by Collins Radio and were instrumental in designing, producing, marketing and supporting Collins Radio equipment. Some of those members are Warren Bruene, W5OLY who designed, among other

things, the 30S-1 linear amplifier and 30K-1 transmitter and was Collins most tenured employee having started in 1939 and retired in 1984.
Member Dennis Day was one of the prime engineers on the 75S-3 and Gene Senti was the designer of the KWM-2, 30L-1 and KWS-1. We are proud to have these fine gentleman who have both directly and indirectly contributed much to amateur radio.

For those who may wish to add to a station or collection, the CCA attracts an elaborate and reliable network of equipment sellers as well as members who may be interested in selling or trading their own gear.

How does one become a member of the Collins Collectors Association?

Any person who has an interest in Collins Radio is welcome to join us.

Annual dues are $15 for those living in the US and Canada and $18 elsewhere. Again, this includes the membership certificate and our quarterly newsletter, The Signal.

Mail your remittence in US funds to:

The Collins Collectors Association
PO Box 840924
Pembroke Pines, FL 33084-0924
E-Mail: collins@exis.net

We support a 2-way exchange of information with our membership and encourage everyone to share their experiences. The Association offers

the best benefit and value to all when members share their Collins related experiences and situations.

How do I stay in touch with and participate in the CCA?

Besides our quarterly newsletter, the CCA currently has 3 affiliated nets which meet weekly. They are as follows:

The 20M net meets every Sunday on 14263 at 2000UTC. This is our formal,
directed net which usually has the greatest number of check-ins. It is dedicated to both technical subjects and the listing of equipment buy/sell opportunities.

The CCA also supports two weekly 75M nets. The first meets Tuesday nights on 3805 at 0100 UTC and the second meets Thursday nights on 3875 also at 0100 UTC. The 75M nets are designed to be informal with open discussions and the least amount of structure possible.

>Gary... KJ6Q...

Amp Supply is out of business. The LK550NT sold for $2,250 retail
(there was no NTC). Several dealers sold the amp and the average ham
net was $1950. The regular tune version was $1895 retail and averaged
about $1600.

>
> http://www.acsys.comSorry wrong number!

With ADMS software you can enter Rx freqs up to 999Mhz...There is no 900 Mhz tuner section but it can be done. During a visit to L.A. I entered all the LAPD 500 Mhz freqs into the 51 before I left home. It worked great as a scanner. Basically you can enter any freq from about 60 to 999 via ADMS software.

In the Win.ini file you will fnd a section marked FT51 Programmer

You must enter this statement in that section:
allowanyfrequency=1
The above will then let you enter any Rx freq via the software only, not the keypad. If you have an old version of ADMS pop over the my Homepage and download the latest patch....http://www.cris.com/~lsbutler

>to monitor the local police, who are at 471.1375 MHz and most HT's don't
>receive that high unmodified.

For the record, EZ Clone will program the FT-51R with frequencies from
000.000 to 999.999 MHz, including 471.1375. The radio will display
that frequency on its display, and we've even got the FT-51R to
receive signals at 471.1375. Of course, I doubt the radio will
receive 800 MHz. :^)

More info on EZ Clone: http://www.acsys.com or ezclone@acsys.com

>Nice try on justifying the demise of the CW requirement but...

> NO DICE!

> CW STAYS!

'Oh, Plezzze!

CW sucks, Elmer. Even the US Coast Guard no longer requires it! And for good reason... CW is a dead, useless, outdated, archaic mode of communications. Face it, CW is dead ~ finished. I'd sooner use a jungle drum.

Can you imagine how many talented persons have been locked out of our ham radio fraternity because they couldn't learn the code? Otherwise, these are very gifted engineers, technicians, programmers, non~technicals, just plain folks from across the whole US; citizens all. All denied the ham radio privilege because they could not learn/retain the stupid code! Even the feds finally woke-up to that. ARRL did too, think of all the memberships they were missing out on?

As a ham for twenty five years plus, I've used CW only once, really, to upgrade to General because I was interested in 10 meters. A important point is that I have never USED CW on ten or any other band with exception of 1 year as a Novice in high school! I hated code then, I hate it now. The guys on two meters tested me over the air a few months back and I passed... That and a cup of coffee, I'd take the coffee.

If there must be a requirement for code, it should be for those who WISH to qualify for the code spectrum(s) set aside within our ham bands now. So how about a ham license with code endorsement? What's wrong with that? Those purest cuckoo's who live for the dah-de-dah's can pound till the cows come home!

We left our caves and spark-gaps behind, now it's time to burry CW. Hurumph!

Zack Schindler, N8FNR (zaax@aol.com) asked:

> Does anyone out there know of any company that produces a
> paint that reduces RFI?

How about emulsified copper head gasket spray paint? You get it from auto parts stores.

I've never tried it for RFI shielding, but it may be a quick solution to your problem -- spray it on and ground it. Easy to check with an ohmmeter to see whether or not the binder prevents adjacent particles from conducting.

If you try it, let us know if it works!

From: jayk@fc.hp.com
Message-ID: <4hf4cf$dc8@fcnews.fc.hp.com>
Source record: 204908

On a somewhat related subject. My 706 has rated output on HF and VHF
in the CW mode. However on SSB it only puts out about 30/40 watts on
HF and ~4 watts on 2m. If I whistle in the mike I get near CW output
but speech, no matter what the volume, produces the lower output.
The mike seems OK, turning the mike gain up doesn't make much difference
after level 2 or 3 and the processor only helps a little. ALC levels
seem normal and the 706 output meter indicates power out. I have tried
it on two good power supplies. Don't think it is pilot error. Any ideas
out there? ICOM tech support says send it back.

Does the 706 have a internal SSB power adjustment like some radios (my
old TS-930 had one)? How much does your unit put out on SSB?

When *properly tuned* a good tuner will produce about .5db of insertion loss. So, the amount of RF power that a tuner consumes depends on how much power you put into it.

3061. STANDARD C508A: External Antenna?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-04 00:00:00 UTC
From: andy@clark.net
Message-ID: <4hfdc0$n2a@clarknet.clark.net>
Source record: 204911

Has anyone found one of those little mini screw-on connectors/adapters for the C508A antenna jack? Might be nice to try an external antenna sometime, but I've never seen a connector quite like this one.

BTW...are you as impressed with this unit as I am? The aircraft receive is the best I've ever heard; it even beats the reception on Standard's own C288A. Batteries seem to last forever, and it's just not that hard to get into a repeater with 280 mw. Would have just preferred a normal BNC antenna connector, though...

Hi Rich.

I built a simple a simple attenuator at Radio Shack for just a few bucks, and it works great!

Just get one of their small metal (has to be metal!) project boxes, put a solder type chassis mount SO-239 on each end (2), and put 2 100k potentiometers inside (knob on outside of course) in series.

Ive used mine to win over a dozen hunts, and works with an HT too. Just remember to keep the line in between the attenuator and radio as short as possible, and dont transmit if you have loaded any resistance on the line.

Good luck, and e-mail me back if you need more specifics or part numbers.

Take care.

3063. Answer for FT 900 - spontaneous shut down

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-04 00:00:00 UTC
From: "Gregory J. Buhyoff" <buhyoff@vt.edu>
Message-ID: <4hfac3$l6v@solaris.cc.vt.edu>
Source record: 204913

Well, I just called Yaesu and here is what I found out. There was a CPU problem on some early versions of the FT 900 that would cause a spontaneous shut down. It was not indigenous to all radios even if they were part of the same manufacturing lot which contained some radios which suffered the problem. You can check to see if your radio is affected. Hold the A/B button and the V/M button while turning the power on. First, the display will light up with LCD segments displayed. After a slight delay the display will show a batch of numbers. The first three numbers (and the largest ones on the display) indicate the version of the CPU. If the number is 151 you have the newest version of the CPU with the fix for the problem. If the number is less than 151 then your unit may be display this problem, at some time and in random fashion. The reason I asked is that I bought a brand new FT 900 from AES last week and I noticed that, oddly, the serial number started with 4J06... Thus, I knew it was manufactured in October of 1994!! I knew that t this problem existed in some of the earlier units. My unit, however, has the new CPU unit in it. It displays a 151. So if you have a serial number later than 4J06... you are probably OK. I don't know why AES has brand new units that were made in 1994 unless Yaesu manufactured large batches early or if these were part of a very large stock. No matter. The mystery is solved as to the determination of which FT 900's may be affected by the spontaneous shut-down problem. I just wanted to share this information in case any of you are in the process of buying a used FT 900 (or a brand new one, for that matter!).

Paul,

That's a very blatent claim you make. This patent went through with only one need for clarification from the PTO. Obviously know one else sought such a patent which is evidence by the PTO issuing me patent # 5457342.

Those companies you mention have devices that are similar with respect to cooling only if you care to follow the patents mentioned on my abstract. However, NONE have developed the device I have NOR do they have a patent on such a device. As such, I am the sole owner to pursue development of this product or companies under infringement.

From: Montbach/Bartlett <caspar@tiac.net>
Subject: FT-40 mod info here

I found the tx mod for the ft40, it consists of removing a 0 ohm resistor from the radio. In my attempts to find additional mods, I found another set
of programming parameters. By holding down the lamp, ptt and top-notch buttons, you bring up some sort of diagnostic mode. It allows you to set the
L1, L2, L3, and high power levels (will tx 7.5 Watts with 13.8v, don't do this too much, it gets hot) and s1 and s9 levels (don't try to set these without an accurate signal generator). there are 3 other parameters I haven't
figured out; hssq, thsq, tisq. If anyone finds any other hidden keypad or jumper mods, let me know. BTW, I also figured out which jumper makes the

cpu
think it's a 2mtr radio. 73, Will

Jeff, it sounds to me like your rig has both the upper and lower sideband carrier oscillators turned on simultaneously. That's the only thing that comes to mind which could cause the sort of problem you've described.

I don't have any Kenwood gear so I can't provide any hardware troubleshooting
tips. Hpoefully someone else will step forward with more details. Good luck.

From: k5qq@aol.com (K5QQ)
Subject: HELP! with TS-520S cw receive

There was a note about hearing a signal on both sides of the carrier frequency. The problem was very pronounced on the TS820, but not nearly as bad on the 520. I didn't notice it till I bought a Sherwood filter that had such tight sideband filtering. Anyhow, after a lot of work, I figured it was signal leaking around the filter. What I did , on the 820, was to solder a shield on the bottom side (opposite side of the components) of the circuit board. I insulated it so I could push it right against the board and it did wonders.

I never had a real good filter in the 520, so I didn't notice the problem, but suspect that is what is really happening. It's quite distracting when you tune a station that you are on the wrong side of.... especially when you are just tuning the bands.

Good luck and give it a try. I bought some very light weight tin at the hobby store and it solders like a champ..

Adios

Subject: Info req'd on TEN TEC 1208 6M TRANSVERTER

Hi.

Just new to Oz is the Ten Tec 1208 6M transverter kit.
Haven't actually seen one, just a brief reference to
one in the 96 Daycom catalogue.

Has anyone built one of these kits up?
How do they perform.
Are they broad enough to cover the full 4MHz?
Is the standard I.F. 14MHz?
PWR O/P is quoted as 8W. Whats the PA consist of?
Is the kit reasonable quality or crap?

etc etc.

My intended application is to team a 6M transverter up with a
high end HF box with DSP etc. probably an FT-1000MP when they
become available out here in 2/3 months.

I did build a VK5 ESC 10/6M transverter a couple of years
ago - and performance was very ordinary!

If you have any info please email me.

Cheers,
Adam VK3ALM

The FT-51 can receive this frequency (471.1375MHz) but it requires a hardware mod or
useing the ADMS-1 software. The default setting for the software is the same as the
radio. That is, to program frequency outside of the normal operating range you have
to change a setting in the WIN.ini under the section FT-51 Programmer. This will
allow you to program ANY frequency from 60 to 999MHz. The radio will only receive
from 100-180 and 375-525 MHz. Transmit frequency range is not controllable by
software, it does require a hardware mod.

On the SX-28 the tuning knobs appear like spoked wheels. Looks like there are 12 knobs, 3 on left, 3 on right side, 3 across the middle with the switch in the middle bottom, and the two tuning knobs.

This is what I find in the book by Raymond Moore, Communications Receivers.

Model: SX-28 Super Skyrider YRS: 1940-43, price $159.50, Bands:6, .54-43 Mhz, IF 455 KC, Filter: Crystal, Tubes: 15, 6AB7, RF1, 6SK7, IF2, 6SA7 mix, 6SA7 hfo, 6L7 IF1/NL, 6SK7 IF2, 6B8 det/meter amp, 6B8 avc amp, 6AB7 noise amp, 6H6 noise rect, 6J5 bfo, 6SC7 af1, 2 6V6 push pull af out, 5Z3 rect. Over 50,000 built, includes A model.

Model SX-28A, Super Skyrider YRS; 1944-46, price $223. Same as SX-28 except added permeability tuned, higher Q inductors in front end. Inductors and trimmers for each band were mounted on small, indiv chassies for easy removal.

Model SX-28FCC special, manf for FCC, differences no know.

Hi Craig, that's a great idea - and worth a try - but I'd sure want to try a little on an non-critical part of the box. The carrier/binder may attack the material that your'e shielding. Also, I'm not sure if this stuff actually hardens. It may remain a sticky mess for quite a while.

What I am wondering is what this has anything to do with amateur radio antennas, homebrew, space, etc.? The point is that this, and the preceding posts were made to the amateur radio news groups.

Cooling of microprocessors, and your grandstanding of being awarded a patent are of no interest to me or in any way pertinent to my interest in amateur radio. And that is why the newsgroup(s) have those titles.

If you are looking for invetors, get a clue and do it somewhere else.

If you are simply so proud of yourself for being awarded a patent for what appears to be anothers work, then HIP HIP HOORAY for you! Now grow up and go away.

3075. Yaesu Relay - Will this work??

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-04 00:00:00 UTC
From: rval58@aol.com
Message-ID: <4hfnui$ie7@newsbf02.news.aol.com>
Source record: 204925

I plan to setup a relay on my FT-1000 -- Does this sound like it'll work OK?? :

Get multi contact 12VDC Relay.
Connect one leg of coil to center pin +13.5VDC output jack on back of radio.
Connect other leg to center pin of TX GND jack on radio.

When PTT activates, relay should activate, and I can make various connections, eg , 117VAC on air light, rcvr muting to boatanchors, etc..

This will work, won't it? I assume TX/GND is a relay contact to GND. Just looking for a confirmation from anyone, don't want to fry things.
- Thanks! N1SQJ

I'm trying to receive an out-of-state but strong signal AM radio station (WSM-AM in TN to be exact) but have a hard time getting it. I can do OK from my car (with a fair amount of fuzz but at least recognizable, especially at night), but can hardly get it in the house. I currently have a loop antenna that came with the stereo attached for AM signals and a fancy-looking FM antenna that I bought (which helps improve FM signals) for the FM. Please, in your E-MAIL, tell me how to improve my reception in detail but not too technical. Also, how would I do the same for distant FM stations? Thanx to all who helps in advance!

3083. Icom W21AT Wide RX problem..

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-05 00:00:00 UTC
From: herb@alpha1.csd.uwm.edu
Message-ID: <4hgi8o$h7t@uwm.edu>
Source record: 204930
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I have done the keypad mod for extended RX, but it doesn't recieve much. I read on an FTP site that this it the way to do it. However, at a local repair shop, I was able to view a mod book for Icom radios. It cites the addition of D-23 (MA132WK) as the RF expansion mod. Has anyone tried this? Is it possible that Icom has stopped including this in the W21AT radios? I know the keypad mod works on the earlier models..... Perhaps they no longer include this diode. In the book, it said to do the keypad mod only AFTER inserting the diode/ So, maybe mine TUNES out of band, but requires a diode to actually RECIEVE out of band.. Any experience with this?

Nate, KB9LSX

Thanks alot!

3084. Drake TR4 Audio Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-05 00:00:00 UTC
From: k1el@aol.com
Message-ID: <4hislj$pcs@newsbf02.news.aol.com>
Source record: 204931

Hi All, I have a problem with my Drake TR4 that I have been fighting for some time now and can't seem to figure it out. The receiver has good sensitivity and good quality audio when receiving weak signals. On strong signals the receiver acts as if it is overloading, distorting badly. I first thought that the AGC circuit might not be working properly. But in checking the AGC voltage it looks OK, directly coresponding to signal strength. Another clue is that the S-meter is deflecting properly which again tells me the AGC is working OK. I have checked tubes and other components and can't seem to find anything amiss. Any ideas would be greatly appreciated

Thanks es 73s de Steve K1EL

3085. Sale - HF Tribander Beam

What do you expect! In SSB mode, the peak power is indeed 100W. With speech, the average duty cycle is something like 25%. With a processor or by shouting you can get this up to maybe 40%. Whistles are tones at the peak power, hence you see 100W. Unless you use a peak reading power meter, you will not see the actual peak power on SSB, but some average determined by the dynamics of the power meter.

Mike

3089. ft-530: Safe to use "AA" nicads with batt. case?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-05 00:00:00 UTC
From: Jeff Clark <jefco@got.net>
Message-ID: <313C0572.3AED@got.net>
Source record: 204936

I recently bought the "AA" battery case as a cheap backup battery for my Yaesu ft-530 with the idea that I would fill it with Ni-cad "AA"s. Unfortunately the manual indicates that the case "lacks the necessary thermal & over-current protection circuits..." & "must not be used with rechargable cells".

I'm assuming that it is safe to use "AA" nicads for Rx/Tx but that Yaesu would rather I didn't charge the cells while attached to the radio (via the external DC jack on top of the case) because the case lacks a current limiting circuit.

Does anyone have any experience with Ni-cads & the FBA-12 battery case?

Having too much time on my hands, I went and looked at your patent.
The first part of the patent describes the exact CCD cooling method
used for years by Santa Barbara Instruments (and others) for cooling
CCDs. Your novel claim seems to be an IC cooler that is retrofitted to
an existing, uncooled IC.

Ah, excellent Kevin. I figured that was the way to do it (intuitively),
but couldn't muster the math to make the case. You have done so nicely.
So we don't need the movable current probe after all.

>calories to watts.

Excuse me, but this is an absurd way to do calorimetry. Most of the
heat generated by that 10 minute key down period will dissipate to
the ambient air around the tuner. All you'll get after immersion
is the residual heat in the materials of the tuner. That's hopelessly
inadequate.

If you must do calorimetry, then you need to insulate the tuner,
say in a styrofoam cooler, and measure the rise in *air* temperature
inside the cooler during and immediately after transmission. You'll
still have some error from heat conducted away by the connecting cables,
but it'll be much closer than dunking the tuner after the fact.

>The problem isn't the tuner, the problem is the placement of the tuner,
>and the loss of the feedline. Place the tuner at the antenna, so the
>coax is loaded and fed as 50 ohms and the loss of the tuner will be
>minimal.

No, that doesn't change tuner losses. It does eliminate line losses,
which can be significant in some cases, but the tuner is still having
to do an impedance transformation (else why use the tuner), so there
will still be circulating currents in the tuner components, and there
will still be I^2R losses in the tuner, just the same as if it were
matching that impedance at the other end of the transmission line
(assuming the impedance would be the same at the other end of the
line, which it could be arranged to be by using multiples of a
halfwave for the transmission line length).

Please e-mail responses.

Thank you. 73's K7PTZ

3097. 33MHz mod for a TM-741A w/UT-28s

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-05 00:00:00 UTC
From: spade@onramp.net
Message-ID: <4hgnkc$cce@news.onramp.net>
Source record: 204944
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.amateur.swap

I have a Kenwood TM-741A with UT-28s 10 meter band unit added. All faqs I have seen state that cutting the green wire and removing R54 & R55 will enable Tx from 26MHz to 45 MHz, and Rx from 18 MHz to 54 MHz. I bought this radio with this mod and have checked and verified it. However, when I try to Tx in the 33MHz range my output is only about 1.5 watts. It will not receive at all here. I am a vol. firefighter and my dept. as well as almost all other VFD's around this area use the 33 MHz range. My Rx & Tx in the 2 meter and 440 mods check out fine. (I'm using 155MHz & 450 MHz ranges.). Can anyone offer any help? Thanks.

>I'd appreciate anyone's thoughts on the IC-706.

It's a GEM. It has very few faults, though it does have some, no
radio is perfect. HF through 6 meter performance is excellent for
a radio in this size and price range. On HF, performance is on a
par with the venerable IC735 in most situations, better for digital
modes, though you will have to use the preamp and attenuator settings
more often than you do with the IC735. 100 watts on 6 meters is very
welcome, And 2 meter operation is fine too, if you don't mind that
it only does 10 watts (perfect to drive a high power external amp).

The most serious deviation from advertised performance is the
poor sensitivity on receive *outside* the 2m VHF band. To put
it bluntly, it sucks as it comes out of the box. There are two
different mod approaches to solving this problem. One, called
the "yellow wire" mod, makes the radio use the 2 meter bandpass
filter above 2 meters. This at least lets you hear the US Wx
stations at 162.55 MHz, but doesn't do much for you up toward
the 200 MHz upper limit of the radio. The other approach is
to modify the VHF receive filter normally used outside the
2 meter band so that it actually passes the frequencies the
radio claims to tune. This isn't a hard mod either, though
it takes a bit of skill working with SMD parts to do it.
With this mod, you hear everything the radio is advertised
to hear with good sensitivity. Of course you also hear IMD
that you didn't before the mod, but that's the price of very
wide receive coverage. The radio still uses the 2 meter bandpass
filter when inside the 2 meter band, so it still performs fine
there.

The radio has a wideband FM mode that lets you listen to FM
broadcast signals. Unfortunately, the IF filter for this mode
is too broad, and you can have problems separating stations
on adjacent channels in some cases. This is mostly a gimmick
feature, however, and it may not be worth your time to replace

the filter with a narrower one.

A more serious problem reported by some is that the CW keying clips the initial dit in QSK. This seems to annoy Morse operators, though I find it of no consequence (I don't operate Morse when I can help it, and when I do I don't use QSK). The radio performs nicely with more modern digital modes such as Clover and PACTOR. It properly positions the narrow filter (optional) to match the tones used for those modes when placed in RTTY mode. And when in CW mode, it shifts the narrow filter down to the proper tone for that mode too. And it offers IF shift so you can customize the passband to suit your needs. It also has a *slow* tuning mode that is wonderful for Clover operation.

The radio is a joy to use mobile. The detachable, and very legible, faceplate makes it easy to mount in even the most cramped auto. The control system is very easy to learn, and very suitable for mobile operation as well. It is also CI-V compatible for computer control, has two different ways to control an external antenna tuner, etc. The back panel is *full* of option connectors. If you need it, it's probably there. (No transverter jacks though, pity, but you can lower the output power of the rig via a menu so it can drive a transverter through its normal antenna connectors. It has 2, one for HF & 6m and another for 2m and VHF receiving.)

Considering its price and size, you can't really go wrong with this radio. With the noted exceptions, it does what it claims to do, and for the most part does them very well. I consider its minor faults to be a challenge rather than a handicap. I've spent a good deal of time poring over diagrams (order the service manual, no schematics come with the radio as shipped, a *serious* flaw IMHO) and poking inside the radio to discover the fixes for its deficiencies, and have had a blast doing it.

The more you study it, the more you come to appreciate the soundness of the basic design (unlike some radios whose name starts with K that I could mention). As a ham bands radio, it works fine right out of the box (with the exception of the QSK problem noted), and as a VHF wideband receiver, it can be easily fixed to perform well there too. (Out of band VHF Tx is another matter, it can be done, but it isn't simple, and screws up the radio for other uses. Don't buy this radio for out of band VHF Tx, you'll be unhappy with the result. HF out of band Tx is a very simple mod, however.)

Alinco and Yaesu offer competing radios. The Yaesu may be a slightly better HF radio, but it is bigger, and HF only. The Alinco is cheaper, and has 6 meters, but lacks 2 meters and some of the other neat features of the IC-706. I think the IC706 offers the right combination of size, price, and features to win its class. Apparently a lot of other people do too.

>I have a Kenwood 733A and get serious intermod problems on 2 meters.
>Is this characteristic of most dual band rigs? Is there anything I
>can do with the antenna to reject some of the intermod? Thanks.

It's characteristic of the Kenwood (and to be fair of some others
as well). There are two solutions. There are bandpass filters
sold by Tucker and Alabama Radio that will limit the out of band
crud from reaching your radio. Of course you can only receive
2m signals then, but at least the howling monster is tamed. There
is also a notch filter available that will kill just the pager
segment of VHF. If it's pagers driving you mad, this may give you
some relief. I don't recall the manufacturer, but they advertise
in QST. In any case, these filters go in the transmission line
between the radio and the antenna.

> there?
>

It looks like 1000MP is superior to 775DSP in many aspects. It is quiter,
more user-friendly, and... MUCH cheaper (almost 1000 bucks less). The
biggest drawback of 1000MP is its "low" power (100 W), which is not enough
for driving 2x3-500Z amplifier for full output. The only other advantage
of 775DSP I found is much better manual notch filter.

After long thoughts, I bought 1000MP -- and do not regret. Now I am waiting,
until Fox-Tango will design IF filters for it...

Still, none of new digital radios can outperform old good Drake R4C with
proper alignment and good filters! But to have all in one box, I think
that today 1000MP is the best ham transceiver money can buy.

Source record: 204817

L0pht Heavy Industries has designed and may produce a pager 'interceptor' / POCSAG decoder. The device is powered off the serial port and fits inside a DB25 hood (it is 1.1" sq.) It is possible to monitor pager data transmissions at 512/1200/2400bps and will decode both numeric and alphanumeric messages. The device is used with a radio scanner (not included) and PC software.

We are trying to determine the current market interest for such a device. If you would possibly be interested in purchasing this item, please send us an e-mail (pocsag@l0pht.com) letting us know if you would want it available in schematic/kit form or as a fully-assembled unit, and the approximate market value of this product.

Thanks.

Steve,

I have had good luck using some Sony headphones from a "Sony Sport Walkman". These are yellow colored, and actually fit into the ear canal instead of the traditional 'phones that cover the ear.

I find the fidelity super, and they are very lightweight. Also, the cord is kinda "tangle proof" and easy to spot since it is bright yellow colored.

Only catch is that these are stereo. A stereo to mono adapter should solve this problem. Most newer HF rigs use the stereo phones jack anyway.

Price for replacement is well under 20 bucks too....

Tony,
It's nice to see that some repeaters still try to abide by FCC rules
and the Golden rule. I'm from western Colorado where most hams abide
by the same, but while I've been in Phoenix the last month, I've heard
so many conversations on the 146.940 repeater that I would not even
discuss over a cordless phone, let alone an OPEN repeater, that I am
very disapointed with some of our ham brotheren. They sounded as bad
as CB'ers. I have been a ham for along time, testing for novice, then
Tech at the FCC because there were no VE's then. I'm on my third
license and my second call, and it seems that common courtesy on 2m
and UHF repeaters has gone down hill greatly. Hang in there.

John,
Try the Icom W31A instead of the Z1A. It's easier toe program and has
very much better RX audio than the Z1A. I would recomend either the
IC-W31A or the Yaesu FT-51R, as I have experience with both. I am
presently using the IC-W31A and thinking of another FT-51R/HP for a
second Dual Band HT. I don't think you would go wrong with either one.

I expected the meter reading to act like my other radios. As you (and others) pointed out what I am seeing is a function of an average reading meter. I'll explain how I made this mistake.

Both my FT-1000 and TS-930 easily put out 75+% of their CW value on SSB using a average reading meter. A little testing at home last night reminded me why. The IC-706 has AF processing, my other two rigs have RF processing. The 706 puts out 100W on CW and I see about 30W on the average meter on SSB. If I turn on the processing it adds three or four more watts. My TS-930 puts out 110W on CW and about 40W average on SSB. When I turn on the processor in the 930 the average power goes to 80W. Its been about 20 years since I owned a rig without RF processing. I forgot how much difference it make on the average. So it was indeed pilot error on my part.

On a peak reading meter I do see a fair amount of power on the 706. However on the other rigs, with RF processing, there is very little difference between peak and average (as you would expect).

Thanks for the responses.

>tomching <tomching@intercon.net> writes:
>>ADMS-1.
>>If you want to do this, you can try EZ Clone.
>>http://www.acsys.com

I don't get it. Yaesu DID NOT develop ADMS-1, they bought it from a small company that developed it and had been selling it themselves for a while. So are all the radios that were programmed using ADMS-1 before Yaesu bought the software tainted in some manner? And what of all those fancy HF radios on the market that can be computer controlled by various makers software packages? Are all those radios under suspicion?

Amateur radios are not the same as other forms of consumer electronics. There are no labels declaring "No User Serviceable Parts Inside". Amateurs are SUPPOSED to be fiddling about with their toys, and the manufacturers expect it. Were Yaesu to go about invalidating warranties every time an amateur programmed a radio, they'd pretty quickly be out of business.

Why buy EZ-Clone over ADMS-1? It's quite simple for me. ADMS-1 is a Windows application, requiring the large $$$ platform of a Windows based machine. I need to reprogram my FT-51R on the go and in remote locales from a cheap old 8088 based laptop with onle two 720K floppy drives. My understanding is that EZ-Clone will readily run off of one 720K floppy. What I'm doing is using the toy for SAR operations, which can occur in many different regions. Should I buy a laptop that will support Windows so that I can run ADMS-1? Now that would be absurdedly expensive!

If Yaesu wanted to support this part of the market they've had plenty of time to do so. Both Yaesu and the original maker (I've lost the prior company's info) heard from me on this. I've ordered EZ-Clone as a Beta Tester, it should come in this week.

That is all.

Chris - N7RME

I suspect several people will consider this heresy, but I recomend using
the best high fidelity headphones you can find, and a stereo-mono adapter
if your radio needs it (some radios today will already work properly
with stereo headphones). I think the best lightweight headphone is the
Koss PortaPro.

The reason some may consider this heresy is that this type of headphone
has a very wide bandwidth, and they will urge you to get headphones with
restricted bandwidth to reduce the high frequency noise you will hear.
This is, IMHO, a mistake. You should do any necessary filtering electronically
before the signal is fed to the transducers. The reason for this is that
restricted bandwidth electromagnetic transducers have high THD (5% to 10%
is not uncommon), and excessive phase distortion, and that leads to listener
fatigue. It is far better to get the necessary filtering done electronically
where THD can easily be held to a fraction of 1%, and then feed that filtered
signal to a transducer which will have low THD in the restricted bandpass.
(This is similar to a crystal filter, which has large non-linearity near
its passband edges, but can be quite linear in the center of its range.)

The Koss PortaPro is also quite sensitive, so you can run reduced receiver
volume. This is also good, because typical receivers start to have large
THD numbers when driven toward higher signal levels. So running at reduced
volume settings can also reduce listener fatigue.

If your receiver's audio stage generates excessive hiss and hum, its
design is broken, and needs to be fixed, not just masked by limited
response headphones.

If you don't like the average response, you can change the metering
to peak hold by turning intial set mode function 4 on.

>However on the other rigs, with RF processing, there is very little
>difference between peak and average (as you would expect).

As I would *not* expect, unless you're compressing the absolute hell
out of the signal. The only difference between AF compression and RF
compression is that one is done at AF while the other is done at
RF. The end result is the same. Where RF processing pays off big is
if you are *clipping* the signal with a RF clipper. Then you can use
a good filter to remove products that would have appeared *in-band*
if you had done the clipping at AF.

But compressing to the point that the speech waveform only has a peak to average ratio of 1.375:1 would result in a nearly unintelligible (and probably broad as a barn too) signal. It does little good to be loud if you sound like you're talking through a mouth full of mush.

Note that the audio response of this radio has a lot of low cut, so there is very little bass response, and this may tend to exaggerate the appearance of low average power output when the compression is on. But low frequencies don't carry any intelligence in human speech, though they contain most of its power, but that's just wasted power. That may be why you're seeing such high average power readings with the other radios. The output is mostly useless low frequency components, while the intelligence carrying frequencies may not represent much average power at all.

If you *must* have boomy bass, replace C428, C402, and C169 with 4.7 uf capacitors. (A tip of the hat to Frans Veldman for this fix.) I suggest you leave it be, however, and go for intelligibility rather than empty meter readings.

BTW, the IC-706 should put out 50 watts with a steady 1.5 kHz tone input to the mic connector at a level of 10 mV. If it doesn't, adjust R511 on the main board (just to the front left of the optional filter socket) until it does. This sets total transmit gain, and should be done with power set to H and mic gain set to 5 on the quick set menu, and compression OFF.

Now if you increase the input signal to 100 mV, output power should be 100 watts (and ALC should be at the set mark). If it isn't, on HF adjust R95, on 6m adjust R98, and adjust R338 for 10 watts on 2m. If you don't have the service manual, R95 and R98 are the middle two of a row of four pots just to the left of the ribbon cable connector on the main board (remove the top cover). R95 is the second from the front, and R98 is the third from the front. R338 is just to the front of the right edge of the connector that has the infamous yellow wire.

If you have an *accurate* AF generator, and you confirm or adjust to get these conditions, the radio should behave as rated with the furnished hand mic, and if you set the compression pot to 11 o'clock, when you speak into the mic you should be compressing for maximum signal with best intelligibility. If you don't have an accurate audio source, don't go monkeying around with these pots.

3135. 800 MHz RX Mod for IC-Z1A

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-06 00:00:00 UTC
From: lui@netcom.com
Message-ID: <lui-0403961721170001@192.0.2.1>
Source record: 204835

I downloaded the GIF file with the ICOM mod sheet for the IC-W31A, which includes mods for 800 MHz RX and out of band TX. Can the IC-Z1A also be modified to receive 800 MHz? The IC-Z1A and IC-W31A seem pretty similar. I do have the mod info for out of band TX on the IC-Z1A, but I'd also like the mod for 800 MHz RX.

Hello...If anyone is interested, I have a 2 meter mobiel radio for sale. It is the Radio Shack HTX-212. I know it is not the best radio on the market, but it is a great starter radio. It works great and was not used much over a year. I have the mounting hardware and the owners manual to go with it. I am asking $150.00, or best offer.

It is in great condition. Please let me know if anyone is interested. You can send email to djj@umr.edu

Thanks,

Dwain

How can SB-220 produce so little output as 600 W in CW? I have a
SB-200 which seems to produce just about the same, around 500-600 W
out in CW depending on the band in question. SB-200 has two 572B's and
SB-220 has two 3-500Z's, so the SB-220 should definetely do better
than 600 W in CW.

I bought one for use primarily as a base unit and for taking on the road for Red Cross Emergency Services work.

I found that for VHF repeater work, unless I missed something in the manual, I had to program all of the local repeaters. There isn't a standard band plan set up in memory for the correct offsets. You need to go in and manually set up the offset. I did all the - offset repeaters and then the + ones.

You have to step through all the channels to get to the memory channel that you want. This is one place where a multi function keypad mic would come in handy if the the software and hardware was set up this way.

Hopefully when the weather turns a little warmer in a few weeks I will be able to get some antennas set up outside instead of the mag mounts on the cold air return for the furnace and the dryer for the HF.

Other than these 2 faults I love the radio and it appears to do what I want it to.

> 2m rig available.

This is a pretty neat little radio. I own one. I've taken it hiking on
the Appalachian Trail with me, and use it for Packet/FM/SSB at home.
It does it all pretty well, but not great.
It's strong signal handling is not the greatest. It's tough using it in a
contest, at least here in EPA. I would think the phase noise is up there too.
I did work 20 grids in the Jan VHF SS with it, an old 13el F9FT yagi,
and occasionally a 160W mirage amp.

Steve,
The jumper pad #3 should be the only pad that is soldered for the mod.
Unsolder all other pads. If you have a newer unit, remove jumper #2
and solder pad #3, then follow the rest of the instructions for
resetting and reprogramming the upper and lower limits.

Tuning stations in on an HQ-180 is a bit more work than on the average receiver.

The controls that you will use most often are the band selector switch (the six-position rotary in the center of the front panel, near the bottom), the main tuning knob (large knob on the left), and the antenna trimmer (small knob at the lower left corner).

The band selector and main tuning knobs are intuitive... but pay close attention to the antenna trimmer, as this can have a marked effect on received signal strength, especially if you switch to different bands using the selector. Probably the best approach is to tune to the general area that you wish to receive stations, peak the trimmer for the strongest signal -- or the most background noise if no station is present at that point on the dial -- and then go for your stations from there. When you bring one in, you can go back and fine-tune the antenna trimmer for maximum signal strength on the meter.

Also note that the notch filter needs to be off to either side of the center frequency, preferably maximum (I leave mine full counterclockwise). If you have this at zero, you're notching out whatever you are trying to tune in... :^)

Other adjustments beyond this are ancillary, such as bandspread (unless you do a lot of ham listening, then it gets used more often), selectivity (again, unless you do a lot of ham listening; I leave mine at 3Kcs 99.9% of the time). Vernier tuning does not seem to accomplish much more than the main tuning if the receiver is properly aligned. Medium AVC response seems to work best for general listening... noise limiter off for best sound... crystal calibrator is useful to see how poorly the dial tracks :^) ...

Hope this helps...

C.K.

I keep a note on my desk that reads:

- For every customer who complains, 26 others remain silent.

- 91% of unhappy customers will never purchase goods or services
from you again.

- The average "wronged" customers will tell eight to 16 people.

- It costs about five times as much to attract new customers as
it costs to keep old ones.

- Solve customer complaints and 82 to 95% will continue to make
purchases.

3160. HT Battery Suppliers - Who the Best?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-07 00:00:00 UTC
From: Alan Raskind <alan.raskind@trw.com>
Message-ID: <313F2F96.134B@trw.com>
Source record: 204767

I read Mike Morris' posting (and the rest of the thread) on Periphex with great interest. My experience fortunately has not been nearly that bad, but Ithink that's because I bought their batteries just after they started selling them. My batteries seemed to hold relatively well. The cases were well made, but one fit very snug and one was somewhat loose.

I guess my real question is that if Periphex doesn't want to support the amateur community, who should we go to for batteries other than the OEM HT suppliers? I personally have never bought any W&W Associates batteries because I had "heard" that their cases were NOT well made and fit was poor. Don't have any first hand knowledge on the quality of the NiCads they use or how they hold up. I am tempted to go to them instead.

So, if we hams stick together, companies that don't want to support us on righteous issues, such as factory reversed batteries, etc., we should go elsewhere.

I (and I'm sure others) would like to hear about experiences regarding other HT battery suppliers (both good and bad), starting specifically with W&W Associates.

How are their batteries?
Case quality and fit?
Life expectancy?
Nicad memory?
What about their Master Charger I that uses "delta negative voltage detection" with the custom charging "cups"?
Does it work OK?
Does this charging method help improve the life of the battery?
What about the quality of the cups and chargers themselves?

Info on any other suppliers?

I'm sure that most of us will be very interested in these postings.

Thanks, Alan, WA6AQC

>The reason for this is that restricted bandwidth electromagnetic
>transducers have high THD (5% to 10% is not uncommon), and excessive
>phase distortion, and that leads to listener fatigue.

Hi Gary,

My concern with stereo 'phones is that their lighter-weight voice coils don't seem to hold up well in communications use. Single tones stress the elements much more than music, even rock, and I've blown every pair I've ever owned working CW. Generally, the symptom is one of voice coil overheating, which causes the elements to buzz due to distortion of the coil form.

Incidentally, there's no reason why a restricted bandwidth or higher power handling transducer should automatically incur increased THD. In fact, some of the differences that provide these characteristics (like increased stiffness of the mechanical components) should improve linearity and reduce THD. This is readily apparent if one compares the specifications of a midrange speaker driver to a full-range, single-cone design.

Regarding phase shift, I would question whether this is detectable over the communications bandwidth without test equipment, regardless of the type of headphone. I think phase shift over that range is really insignificant, particularly in a small, single-diaphragm transducer.

Another thing about stereo 'phones is that the drivers themselves are necessarily heavier than limited-bandwidth versions for a given SPL and power handling capability. It's the pressure of the headband and weight of the drivers (and sometimes uncomfortable cushions) that usually wears me out, not distortion or phase shift. Compared to most cone speakers, even cheap headphones usually sound superb.

Anyway, I'm looking for a set of 'phones myself and a friend recently recommended the Yaesu YH55. They're available for less than $40.00, and according to him, they are true 8 ohm communications headphones. I'd appreciate comments if anyone here has ever used this model.

Yes, the Icom U-400 programs using the ICOM FREQUENCY PROGRAMMER EX-494. Or you can use a ICOM CLONING CABLE OPC-138 to transfer memory contents in a IC-U16 UHF Portable to the U-400. Suggest contacting an Icom dealer. This radio should not cost more than about $15 to do. If you provide all the transmit, receive and PL info they can do it inside of 15 minutes.

Gaerhardt-

I think some of us have jumped to the erroneous conclusion that your
invention duplicates prior art. On the other hand, your statements do not
clearly show how it is different from prior art.

You are looking for investors to finance development of a product that on
the surface, appears to be old technology. I suggest you revise your
"sales pitch", so that it is clear that your invention is (a) new, and (b)
of commercial value. In other words, why would one want to use your
invention instead of existing spot-cooling techniques?

Source record: 204774

Our company, Par Electronics manufactures the notch filter Gary spoke of. With well over 600 in the field notching the pagers has solved all problems but 2- one was NOAA wx (we retuned his filter) the other was intermod being generated outside the radio and NO filter can solve that problem. Small bandpass filters suffer from high insertion loss (5-8 dB) this is why they require 12V so they can be bypassed during transmit w/o destruction.
Our filter features a worst case insertion loss of 0.5dB and is unique in that it is transparent at 70 cM (0.25dB loss).
Give us your snail-mail and we'll send an info packet including HP network analyzer curves.

HAMMARLUND AIR VARIABLE CAPACITORS

::::::::::::::::::::

TYPE APC

Compact, hi-quality variables. Isolantite base. Screwdriver
or hex-wrench adjust.

APC-25 3.0 - 25 mmf 9 available
APC-140 6.7 - 140 mmf 2 "

TYPE MAPC

Midget padding, trimming and general purpose capacitors similar
type APC but smaller. Ideal for small space applications. Gap
.0135 inch. Rotors and stators are nickle-plated brass.
Nickle-plated beryllium copper wiper contact. Tapped (4-40
thread) brass studs in Steatite base permit mounting without
grounding rotor. Tested at 600 volts rms, 60 cps. Slotted
shafts for screwdriver or hex wrench.

MAPC-75 3.9 - 75 mmf 6 available
MAPC-25 2.6 - 25 mmf 17 "

TYPE ???

Identical in size and shape to the type APC, but have military
part number. Rotors and stators are silver plated (tarnished).
Please note that capacitance ranges and values for this
particular group are APPROXIMATE, subject to the accuracy
of my RLC tester.

922-0004-00 2.5 - 30 mmf 9 available
CA-290 3.5 - 60 mmf 7 "

::::::::::::::::::::::

The are all NOS units and are in excellent condition (mil types are silver
tarnished).

$45 + shipping for the entire group (50 caps)

3169. HELP - I get dropouts when recording WAV files.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-07 00:00:00 UTC
From: rmarshal@nectar.com.au
Message-ID: <4hllej$mmr@news.mel.aone.net.au>
Source record: 204776

Hello,
Hello,

I haven't posted to this newsgroup for 4 months or so...a testament to the fact that I have had no seemingly insoluble problems...

that is, until now!

I record a song to the hard drive from my quad CD_ROM through a 16 bit sound card (Vibra-16) but when I play it back (even before compression) there are audable dropouts all the way through!

This didn't use to happen. I tried a different sound card but the problem persists. the only thing that has changed to cause this is I found the need to replace the CD-Audio cable.

Any idea's or suggerstions where to proceed would be overwhelmingly appreciated.

Thanks, Rob.

Rob Marshall,
rmarshal@nectar.com.au

>I have stopped using the ADMS-1 stuff.
>
>Dave Dredge

Sorry for the problems you are having with the ADMS-1 software. From the discription of the problems that you have stated I am assuming you have an FT-51. An early version of the software did have a problem with the way the power output toggle and the splinter channel toggle was backward. If you will call (205-880-3093) or e-mail (rts@ro.com) with your address, I will send you an update program. The update program is a patch to the version you have and it must be installed for the update to work. We try to catch these things before they get sent out but sometimes things get overlooked.

1-205-880-3093

If I am not there just tell the person answering the phone that you need the update program for the FT-51. If you have a Compuserve account you can download it in the HAMNET forum.

Let me know if you have any more problems.

In 1982 I put a Peltier Cooler on a 8087 coprocessor in an IBM computer in an effort to speed up the clock. I had a PC board made and along with schematics and documentation. This progressed into modules for 80287's. In fact I hold the record for the highest speed attained using a 80287 in an IBM AT computer by cooling the 80287 down to -50 deg C.

I therefore have prior documented art on this invention and demand all royaties should be sent to me. <grin>

>Les

RT-Systems! That's the name I forgot! I wouldn't want anyone to misread my comments - I've no hands-on knowledge of ADMS-1 and have not even seen it used. I'm sure it's a fine Windows application. And as I've remarked to the nice folk making EZ-Clone, there's Zero brand loyalty from me at this point as I've not used either product. Was just sharing what I know and spouting a few randomly occuring brilliant and insightful opinions.

>>PAUSE FOR THE LAUGHTER TO SUBSIDE<<<

Les makes a good point, and I would be surprised if he were wrong. But my problem remains that a Windows application just won't do for me. And I've received email from other folks asking about programming SW to run on other platforms (NON-DOS/WINDOWS BASED). Having just received EZ-Clone in the mail, it lists Solaris, Linux and of course DOS as supported operating systems. And I'm told they decided against offering a Windows product. So perhaps this is a product filling a small niche in the market?

>>GET OUT CAN OPENER - OPEN 50LB CAN OF WORMS<<

What I'd *REALLY* like to see is someone come out with aftermarket cables, Radio Interface Boxes and Software to program Motorola products. Yeah, I know, Motorola would sue anyone doing such a thing into oblivion no matter that their patents were not being infringed. But it'd be nice to see some way other than paying vast sums of money to program a Motorola. They make good toys, and could sell lots more to amateurs if they'd provide (or permit someone else to provide) reasonably priced programming ability. When I think of all the good deals on Motorola toys I've passed on because of this I can't help but see this as an untapped market.

>as long as you are not charging the cells.

Besides not being fused, the big problem I run into is IxR drop across the
thirteen pressured-contacts (one at each end of each cell, plus the
one between the two halves of the case). When I tried to draw an amp
on transmit out of the pack, I discovered that the cumulative voltage
drop caused by the contact resistance dropped the pack's output
voltage by just over a volt. So while there's 7.2 volts of batteries in there,
you may only get 6 volts out unless the contact resistance is kept to
a minimum.

I used the 706 in the recent VHF contest on 2 and 6. As a first
experience on these bands, I had a lot of fun. Using indoor antennas, I
made a few dozen contacts, mostly within about one hundred miles. A
couple of stations were more than 250 miles away (on 2 meters). Everyone
that has heard the radio said that it sounded good.

From: Dave Dredge <ddredge@kmg.com>
Subject: ADMS-1 Software for FT-51R

How could they possibly tell how I programmed the radio.
I have the Yeasu software and every time I have used it
the radio has started doing strange things.

In one case, it would no longer switch to low power.
In another case, even though the freq showed correct in the
display it was 5khz high in memory mode but not in vfo.

I have stopped using the ADMS-1 stuff.

Dave Dredge

Subject: FOR SALE ICOM IC2 1/2

>ANYWAY I POSTED AN ICOM IC211 2 METER ALL MODE TRANCEIVER, IT HAS THE
>FOLLOWING:
>- THE UNIT IS AC AND DC
>- IT HAS THE VARIABLE COMSPEC TE-32 PL TONE ENCODER
>- AN ICRM2 REMOTE CONTROLLER KEYPAD FOR PUNCHING IN THE FREQUENCY
>- AN ICOM DESK MICROPHONE
>- OWNERS MANUAL AND SCHEMATICS FOR BOTH THE RADIO AND THE REMOTE KEYPAD
>
> IT IS IN EXCELENT CONDITION FUNCTIONALLY AND COSMETICALLY.
> I AM POSTING THIS FOR KC7KZT A FELLOW HAM THAT DOES NOT HAVE ACCESS TO
>THE NET AS WE DO. HE IS ASKING $400 FOR IT , HIS PHONE #(520)-646-5485.
>OR YOU CAN E-MAIL ME AT hc@primenet.com. AND I WILL RELAY ANY MESSAGES TO
>HIM VIA THE RADIO.

Please ask your frined KC7KZT if he might be interested in a trade
for the above radio. I can offer him $400.00 worth of the
following (might consider part cash/part trade if he can't find
$400.00 worth of gear of mine):

Motorola MT1000 HT - 146-174 Mhz. band - DTMF keypad, 16 channels,
can program the frequencies and PL's that you want - absolute
MINT CONDITION - comes with antenna & battery -- $550.00 incl shipping

HARDWARE FOR SALE
~~~~~~~~~~~~~~~~
NEW!! Adaptec AHA-3985 PCI RAID SCSI controller - FOR SALE
I have one of the above, NEW in FACTORY SHRINKWRAP. This controller
is ideal as a low-cost, high performance PCI RAID adapter for
entry-level and midrange servers. Here is more info:
n Delivers high performance through innovative multiprocessing RAID
architecture.
n Provides three independent SCSI I/O channels
n Supports multiple RAID levels 5, 1, 0, 0/1.
n Supports NetWare 3.11/3.12 and 4.x operating systems
n RAID processor to generate all RAID 5 parity operations
n SCSI command chaining to reduce host system interrupts
n Hot swap drive
n Hot standby drive
n Automatic fault notification
n User defined rebuild
n Alterable stripe width
n 133 MByte/sec DMA burst rate on PCI bus
n 30 MByte/sec synchronous data rate on the SCSI bus (3x10 MByte/sec)
~~~~~~~~~~~~~~~~

n Supports up to 21 SCSI-2 devices on three independent SCSI channels
n Comes with a complete suite of software to install, configure
and manage your Adaptec-based RAID solution:
- Adaptec RAID driver and utility software for creating and
managing array(s)
- BIOS-resident SCSISelect utility to configure the RAID adapter
- Adaptec CI/O software to manage SCSI devices on the network
n Advanced SCSI commands including scatter/gather, disconnect/reconnect
and tagged command queuing, and synchronous/asynchronous transfers
n Supports 255 simultaneous commands
n Device support for hard disk, removable, scanner, MO, CD-ROM,
tape and DAT drives
I only have one of these controllers available. It is,as stated
above, NEW IN FACTORY SHRINKWRAPPED BOX. Retail list is $799.00.
I just saw a wholesale distributor seeling this controller kit for
$639 plus shipping. That being the case, I will sell this board for
$600.00.

FLOPPY DISKETTES (all are pre-formatted MS-DOS)

Smart Notes - like 3M Post-it Notes for a computer!.... $20.00

OS/2 STUFF! I don't use OS/2, so make make a REASONABLE OFFER
on some or ALL of this stuff and I probably let it go! But I
did say REASONABLE! <GRIN>!!! I need to make room in my garage,
so I am VERY OPEN to a REASONABLE OFFER for the ENTIRE LOT:

"OS/2 Presentation Manager Programming for COBOL Programmers" -
published by QED Publishing Group - This book gives you the
techniques and skills you will need to creat business
applications using OS/2 2.X PM. It includes a diskette
containing source code, object code, executable code, SQL,
transaction input and output files, resource and icon files -
everything covered in the book! It is still wrapped in the
factory shrink-wrap and is worth over $50.00, but I'll let it go
for just $30.00, including shipping!

"Introduction to OS/2 - Mentor Notes" - published by Mentor
Technology, still in the factory shrinkwrap - includes book,
diskettes and audio cassette. - $39.95 list - sell for $25.00
including shipping.

"OS/2 In The Fast Lane" - new book - $14.95 list - sell for
$10.00 including shipping.

"10 Minute Guide to OS/2" - new book - 10.95 list - sell for
$7.50 including shipping

"OS/2 the Workplace Shell" - new book - $24.95 list -
will sell for $15.00 including shipping

"OS/2 In The Corporate Environment" - new book - $22 list -
will sell for just $7.50 including shipping!!

OS/2 magazines - 4 different issues - each sell for $6.00,
but you can have all 4 of them for just $12.00 incl shipping.

WINDOWS SOFTWARE!!!!!!

Digiphone - Internet digital phone system system - talk
over the Internet! - includes CD-ROM & 3.5"
diskette ------------------------------------ $35.00 + $5.00 Ship.

Qmodem Pro for Windows 95 - V2.0 - new in box! $75.00 + $5.00 Ship.

Procomm Plus for Windows V2.0 - still in shrinkwrap!
$75.00 + $5.00 Ship.

>You need the ICOM programming unit that plugs into the front of the radio
>or a U16 Icom HT (which CAN be keypad programmed) and a cloning cable.

Yes, the Icom U-400 programs using the ICOM FREQUENCY PROGRAMMER EX-494. Or you can use a ICOM CLONING CABLE OPC-138 to transfer memory contents in a IC-U16 UHF Portable to the U-400. Suggest contacting an Icom dealer. This radio should not cost more than about $15 to do. If you provide all the transmit, receive and PL info they can do it inside of 15 minutes.

Subject: How much RF pwr does an ant tuner consume?

In article <313E8F7A.26DB@ro.com>, johnfarr@ro.com says...

>Sounds like an arc, not an ohmic heating.

No, John. The arc lasted millisecods, and occurred when the sagging
inductor
lost contact with the roller wheel. That polymer form was cooked by IR
heating
in the inductor from the extreme circulating currents in the curcuit.

Stan.

From: parf@aol.com (Parf)
Subject: TT 6M Xverter Question

The TT can use built in T pads to absorb more power if the rig runs 10 or so. I've heard a number on the air and they sound fabulous. They do however use a 20M IF which is unusual but avoids more complex output filtering to get rid of spurs.

Ron,
I've been looking for it for some time now. I've had several responses but none from anyone who has actually done a HR2600 or has one that will go to 11 meters. Also, I've never been able to get a satisfactory answer from an outfit called "Chipswitch". They just want my money first. My HR2600 processor chip is not at all like the one in a HR2510.
Good Luck..

Hello all, I have an Alinco DJ 160 HT rugged unit, until lately. I think it
either got a power surge or something similar thru the mic connection.
I had it wired up for use as the shack 2m radio.

When I turn the HT on it is in VFO, at the default frq of 145.000 and xmit is stuck on. No
matter what I do it won't NOT xmit. Also I can't change frqs at all. I hate to Deep 6 the
thing it has been vry dependable till this episode. Any help appreciated.

Ah but the USPS won't let you stipulate "cash only" or "certified
funds" like UPS and can it still be considered Mail Fraud if the US
Mail didn't even touch the package?

>Sure they have. This is the era of disposable junk. Most
>manufacturers have already adapted. :) 73, Jack WB3U

Hi guys, I've acquired two rotary inductors, two hi-voltage caps, and a 10p-5t hi-voltage ceramic switch. Two configurations are obvious for a balanced tuner - coils in series and caps in parallel and visa versa. That leaves me 3 more positions - any suggestions?

I am very happy with the battery packs I've bought from both Periphex and W&W Associates. Never had any trouble with any of them. As for the W&W packs being physically inferior to the original, I have not seen this. The pack I bought for my Alinco DJ-F1Th is every bit as sturdy as the original Alinco pack, which is saying something (modern Alinco HTs are built astonishingly well). I've used W&W and Periphex packs on my older Kenwood HTs in the past and had no complaints what-so-ever.

FWIW ... YMMV ... 73 de KC5NG

The FRB has 2 cables coming out with RCA plug attached. The red goes to 12 (13.5) volts and the blue goes to ur PTT. In addition, there is a RCA jack on the side the 2 cables exit from and it is also PTT. The two RCA jacks on the other side are Normally closed (on the left when the top is facing you with the connectors aimed down) and normally open on the right.

Steve & Alan,
I have used both Periphex and W&W batteries. I prefer W&W because of their better selection of high quality packs, also higher capacity. You get good and bad with ALL vendors. I personally have had no problems with either of the above.
Another battery vendor worth checking is Alexander Batteries. You will see their adds in CQ and QST.

If it is in good shape, it should worth more than $200! Today the
average proce for KWM2 is about $300-400 (depending on options, age
and condition).

You will hardly find one cheaper, so go for it!

Trade a ICOM IC-R1 wide-band multimode transceiver for a Dual band handheld transceiver. The ICOM R1 covers 100 kHz to 1300 MHz, selectable tuning steps from 500 Hz to 50 kHz, AM/FM/Wide-FM modes, and built in 24 hour clock all in a palm size receiver. Smallest wide-band receiver made and comes with lots of bells and wistles. Uses some of the same technology/features as in the ICOM R7000 like auto memory write on search, five scanning types, and frequency skip functions.

>.

You have got to be kidding. This type of thing is exactly why the net is getting congested. Why are you involving hundreds of thousands of dollars thousands of dollars of others investments and running up costs for other users when a scheme could be developed to control over phone line? It sounds to me like you need to get a couple of ISDN phone lines put in, one at your station and the other at the radio site. Then using a Motorola bitsurfer modem, you split out the two B channels to have one be used for audio and the other for remote control. I would think most newer hf radios have a computer interface on them which would allow connection and remote control by a RS232 connection. Interface and connect the hf radio to the

modem. At your house reverse the process and connect the bitsurfer to your computer. (Hopefully) Presto! remote control via ISDN.

Now for the voice channel. Get a tone remote adapter that is intended to convert a non tone remote base station to tone remote. Cetek Vega makes one or go hijack a control shelf out of a GE Mastr Pro. The pro shelf will need a twelve and a ten volt source. Connect the hf radio to the tone remote adapter or control shelf and start setting up your levels. Also you will need a tone remote to activate the transmitter from your shack location. I recommend a Motorola T1600 series. Nice remote gives you a lot of options. You can even send F1 to F4 though it to make the other end do different things, if so equipped.

Connecting a T1600 to a phone line is no big trick. I would recommend a repeater coil to properly seize and balance the line. Use that on the other port of the bitsurfer to get to the other B channel. What would be really cool would be to have a hears remote unit, one with a dial on it so you could dial directly from the remote and not involve another telephone.

Now, back at the hf site, you will need to develop a circuit for the tone remote adapter so it will answer the phone when it sees ringing. This will be pretty much the same idea for interface as at the home station. Repeat coil with a relay to seize the line. I would suggest a timing circuit that would bridge across the ptt output of the remote adapter to drop the connection if a timeout period is exceeded. That just means you will have to key the mic every ten minutes or something to keep the connection up.

I realize I have not given a detailed solution to your problem, so it's up to you to do the homework. I have done something like this for a remote base station in another state where I can dial in and talk on several local repeaters. I just use my tone remote and touchtones to change channels on a preprogrammed radio. On the other hand, I am not using ISDN, but just a standard voice grade circuit.

To tie up internet bandwidth for an application like this is just plain silly. I think it ranks right up there with broadcasting baseball games and radio stations putting their program material out on the net 24 hours a day.

What really makes me crazy is when I see the spots on the network news where a teacher is shown saying to her class of elementry school kids, "Today, class, we will use the internet to search for information on ..."

Yo, teach. Is there not a room down the hall, a big room full of shelves and (shudder) BOOKS? Have we forgotten how to use the card catalog? Fine. Maybe the desired books are not on the shelf. What about CDROM? How many reference books can be put on a shelf in CDROM form? Why are these people wasting bandwidth when there are better ways to get the information they need without adding to the costs others pay?

I hope this whole internet hype and I stress HYPE dies quickly. It's like using a screwdriver to change a tire. A useful tool, but not the one for the job.

I have gone on here for an extra half page. Sorry for the wasted bandwidth, but I had to let some steam out. At least this only amounts to less than 1k or so.

Kevin KA0JQO

Hmmm Good Point...

Perhaps it would be covered by some inter-state fraud provision or some
such that would make it a federal crime (whatever that means these days).

Having investigated this patent, it appears to cover a very, very
narrow area of widely used prior art. I particular it is a device that
can be added to an existing IC in an existing circuit to cool a single
IC. The
method of coolling (peltier junction, heat sink and fan) has been used
in many different fields - so there is nothing new here.

As far as it practical value, you would have to have room in the
device enclosure to add the add-on cooler, an method of
expelling the removed heat from the enclosure and some source of power

for the add-on
device(s). The needed additional room sounds sgnificant with the heat sink and fan. For each IC you needed to cool, you would need a seperate device.

It also appears that this patent is not even a very good replication of the
prior art of IC cooling. In the abstract it does not mention any method of regulating the IC being cooled. A peltier device will lower the temp of it host device by a certain level from the ambiant temperature. This means that as the ambiant temperature changes, so will the temperature of the cooled device. Regulation sets the device temperature at something less then the full cooling capability of the peltier junction and then monitors the temperature and regulates the peliter junction to insure the
cooled device stays at a constant temperature.

If the cooler is unregulated, then wild swings in ambiant temperature will produce wild swings in the device temperature.

In my humble opinion, this patented device is not worth much. It does not do the job well. There is so much prior art in this field that one could create a slightly different device and not be in conflict with this patent and would probably do a better job.

Ok you incredibly creative Hams out there, help me solve this one!

Since I moved, our Club station is too far away for a price-reasonable =
phone link, and touch-and-go for a 440 link, so ... how about the =
Internet?

The Club site is many times superior to my home site and I need a more =
reliable station QTH for missionary & emergency skeds & activities.

My home QTH is too low for a UHF or microwave link, though I could =
arrange a phone connect to another ham's hilltop QTH and a radio link =
from there ... but that seems too "old-tech".

If we can make a voice call and transfer digital data at the same time =
over the Internet, why can't I use the digital channel for control info =
& still do the voice?
I have no idea what sort of Internet account the Club station would =
need, but I'm sure we could find a way to do it ... I assume a Web site.

Sure, the voice won't be studio quality, but it should be communication =
quality.
The cable system and other methods are promising huge bandwidth access =
real soon.

Someone please surprise me and tell me it has already been done, and how =
... or that you are in the process of setting up such a link now. =
Help!

Yes. On Sept. 13, 1994 the Mail Fraud Statute was amended to include
"private or commercial interstate carriers". Federal Express and
others lobbied heavily for the bill, as they did not want to be a
haven for fraudulent actors seeking to avoid mail fraud prosecution.
The full text of the relevant section is set forth below:

Dwayne

Your friendly neighborhood air cargo lawyer

>Thanks.

>
Most of us get rid of the MD-1 (or at least the mic portion). You
might try putting in a Heil HC-4 or 5 element and perhaps wrapping the
side holes in the barrell. Good luck.

Hi Barry,

I used to own a 530 and now have a FT-51R. Both great radios. The FT-51R blows away the 530 for AM Rx. I do monitor some A/C freq and the 530 was almost as worthless as my Kenwood 733A for AM. The FT-51R is the BEST I have ever heard.

The batteries are better on the 530 and cheaper too. The audio quality is better on the 51R.

Play with both and listen to to them. Both are good. I still prefer the FT-51R over the 530. It is worth the extra bucks but be sure you get the high powered unit.

>fit was poor. Don't have any first hand knowledge on the quality of the
>NiCads they use or how they hold up. I am tempted to go to them instead.

My experience with W&W has been mixed. I recently ordered some AAA NiCd cells with solder tabs from them, and had been told on the phone that W&W manufactured the cells and they were rated at 220 mAH (a figure also listed in their catalog). It took W&W about a week to process the order, and the cells which arrived were manufactured by Sanyo, not by W&W. I decided to use them anyway since I've had reasonably good luck with Sanyo cells (although I do think there are better products on the market), but after I got them soldered together I noticed they were only rated at 200 mAH rather than 250 mAH; which is the rating of Sanyo's current AAA cells.

This got me wondering just how old the cells were, so I wrote to W&W and asked them to explain the discrepancies. A representative wrote back saying that W&W does not manufacture cells, but uses Sanyo cells. She said the ones I was sold were one year old, and that they did not have any of the newer 250 mAH cells; which I could have obtained elsewhere for the same price. Since I'd already installed the cells I decided that returning them and re-ordering from another vendor wasn't worth the hassle, but I don't think I'd order from W&W again. (One of the cells also arrived with a broken solder tab, but I was still able to use it.)

The W&W battery packs which we've used in years past with our Motorola HTs at work seemed to have a high incidence of premature failure. When I opened up one of the dead ones I noticed that the Sanyo cells inside were specified for a 14-16 hr. standard charge or a 4-6 hr. rapid charge. However, the Motorola rapid charger charges batteries at a 1 hr rate, which the Sanyo cells apparently were not designed to handle. Physically, I don't recall noticing any difference in durability between the W&W packs and the Motorola packs.

I'd say the company I've had the best luck with is E. H. Yost & Co. (MR. NiCd); good products, prices, and service. I've also used batteries from TNR Technical Inc. on several occasions, but their prices have increased to the point where I no longer consider them to be competitive with other mail order establishments. The current issue of "Radio Resource" has a survey of aftermarket battery manufacturer products, but I don't know how many of these companies manufacture packs for the amateur market.

3229. Icom-W31A vs TH79A vs FT51R HT's

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-10 00:00:00 UTC
From: aust@gandalf.sp.TRw.COM
Message-ID: <9603101754.AA13030@gollum>
Source record: 204729

Of the three Dual banders, I would like to hear
from those that have compared all three, especially
the W31A.
Which unit has the best performance on VHF, UHF or both
bands for receive?
Which unit get the worst intermod on VHF, UHF or both
bands for receive?
For Battery life, which has more talk/listen time compared
to the others(which draws most current/least current?
For VCO performance. which unit has the broadest locked rx/tx
VCO?
Which unit has had most returns/least returns?
If you have a unit, are you happy, unhappy, or ?? about it.
As you can guess I am interested in actual performance, not so much as
that it have/not have a PC/computer port for computers/Windows,etc.

Any comments would be appreciated, I have seen mods in the QRZ directory
on the TH79A, FT51R, but none on the W31A, if anyone has any, can you foward
them. Is the any difference between the W31A and its earlier version the
W21A??
Comparing them in the ham store, it seemed by inspection below:
Looking closely at the W31A, it seems it has a more sensitive
UHF receiver than the FT51R for out of band listening.
Another observation was the TH79A has a more sensitive VHF receiver
than the W31A for out of band.
Is the W31A more intermod proof on VHF than the FT51R?

Tempted to get the W31A, is it the best choice between ham band and a
out of band type receiver for an HT rig??
It seemed the W31A had a great out of band UHF sensitivity, while the FT51R
was somewhat deaf, and the TH79A ok, but could only hear up to 470MHz.

If anyone has a mod to get the TH79A above 470Mhz, can you e-mail it to me.
Thanks

73
Mike :-)

Everyone has an opinion, but for my two cents worth, the best dual
band HT I've ever used is the FT51R. I bought Icoms for twenty years,
really liked them, but was so impressed with the FT51R that I switched.
It has great battery pack options, a built in voltage meter so you're
never surprised by a dead battery, a scope to check activity on nearby
freqs, and will receive out of band without a modification.
I won't part with mine, but am planning to sell my Kenwood TH79a
which lacks the sensitivity and wideband receive of the Yaesu.

Yeasu is better for intermod.

Bought both units with the intention of taking one of them back. (I really found people liked both models...though a slight preference for the yeasu was detected).

After testing them around a high rf area, I found the Yeasu to be much better. In fact it seems to be better than my older Icom W2A which was great at the time.

Also seem to like the way the Yeasu programs a bit better. It's a great radio...very happy with the purchase. CHeck out the programming kit to connect it to windows/computer. Makes changing/backing up really easy.

I checked the local Radio Shack, and found that the 19-1126 is indeed in the system. However, none of the local stores has received any.

The HTX-242 is not in the 96 catalog, but is in the computer. (By comparison, there is a computerized oscilloscope probe listed in the catalog, that isn't in the computer yet.) The clerk said that being in the computer indicated it was in the warehouse, but hadn't been shipped. I suspect it isn't really in the warehouse yet, but a real order has been placed with the manufacturer.

What is your secret to getting it up to 52.525? Some of us might be able to solve the tune-up problem if we had help with the synthesizer.

From: Thomas Martin <tmartin@cartworks.com>
Message-ID: <4i2eap$fvb@lou.teclink.net>
Source record: 204663

Has anyone ever figured out what causes the top row of buttons on a Kenwood mic to quit working? I have been in it and checked the connections and solder traces but found no problems. I have tried another mic and it works fine on the same rig. The radio is out of warranty and probably could buy a new mic for what it would cost to repair this one.

Thanks in advance...
tmartin@cartworks.com

Hello !
I use the famous contest logging program "CT", and I know it
is possible to make it transmit on CW for quick responce in
CW contests. I've seen some years ago on CQ magazine, an article
about a simple interface for the TS-440s and the IC-735.
My question is , if the interface for the IC-735 can also be
used to control the IC-725 (wich is the one I have).

Thanks! 73 + Good DX + Good Contest

We recently had a series of break-ins at work, and a number of computers were stolen. As a result (locking the stable door after the horse has bolted etc) we now have some of those plastic stick on pads with cables and locks through them securing the computers to desks and to each other to make it harder to get them out quickly. (Plus lots of other anti-theft precautions, but I'm not going to detail those . . .)

Two questions -

(a) does anyone know of any good theft-proofing methods for radio equipment (apart from the obvious things like buckets of sulphuric acid which are both dangerous and illegal)? Are there any good ways to camouflage kit so that burglars walk past it in their search for sellable goods like VCRs? And how do you fix a plastic-pad-and-cable type security device on a tranceiver where every panel can be removed or has loads of sockets or switches all over the surface?

(b) why don't the manufacturers put a loop for a padlock mount onto the chassis of new transceivers? This is done for some laptop computers, and would make it a bit easier to secure the kit to something solid.

I know that nothing is going to deter a dedicate burglar with plenty of time, but since many burglaries are in-out operations taking only a few minutes, anything that slows the thieves down would, IMHO, reduce the chance of my losing a transceiver.

Cheers

Mark

Hi: I worked briefly at a government facility that was a high security establishment with armed guards wandering the halls constantly, randomly stopping people to check ID cards. Even with that, there was a team that did nothing but go around and secure computers and printers to desks, walls and floors. There's quite an array of kits and gadgets for this purpose. Picking up some computer mail-order catalogs might work in spotting a lock-down kit that would work on your radio(s).

ICOM, quite unintentionally I imagine, supplied the heat-sink on the IC-228H with a cross-bar on one end. After mine was stolen and replaced on insurance, I made up a shackle which dropped between the heat sink fins and was attached by pad lock and chain to the steering column.

It'd be down-right nifty if manufacturers would equip radios with a means of locking them down. Some computer makers design in a place in the frame where a shackle can be installed from insdie the radio, thru the frame and the case. There are also kits for some computers which involve putting a heavy metal frame around it in two halves, the lock securing the halves. Perhaps this approach would work for some amateur radios?

Source record: 204744

I am looking to get a dual band mobile that I can use as a "repeater"
(cross band) for my 2 meter radio so I can get out more power.
It must have a backlit dtmf pad mike and cross over both ways (2m to
70cm and visa versa)...at least I think some do this and some don't.
Currently I only own a 2meter and my main desire for this is so I can use
it when I am away from my car to get further out than my ht will allow.
Here in Alaska we are in darkness a great deal so the backlit pad is
critical. Intermod problems are few in Fairbanks, so although that is a
consideration, it is not the overriding consideration.
Any opinions?

Hi all-

For the AM, get a 5 gallon plastic salad dressing/paint/sheetrock mud
bucket and wrap 40 turns of any old wire around it trying to get about
1/8" spacing. Attach wires in place of AM black plastic thing that came with.

For FM- put 'T' antenna high as possible or go to stereo store and
buy a Terk, Parsec, or Recoton amplified antenna, but *not* over $30!
Then start positioning both of these for best reception. FM thingee
up high.
The bucket is known here as a North Sloper. It will amaze you. Turn off
all dimmers, electric heat thermostats, dimmed Halogen, lamps, and the
Interplaq toothbrush charger.(To get rid of noise).

> I would like to home brew an RS232 to TTL interface
> for my Kenwood TS850sat. Could someone help me out with a
> circuit? Thank you Tom WB2ENV
>

Two easy ways to go.

1. Use a 1488 and a 1489 chip, both 14 pin DIPs. The 1489 has four RS232 to TTL line receivers and requires a 5vdc supply, the 1488 has four TTL to RS232 line drivers and requires a +12 and a -12 volt supply.

2. Use the Maxim MAX232A. Along with the chip you will need 5 4.7uF or 10uF tantalum capacitors and a single 5v supply and the caps are used in a charge pump to supply +10 and -10vdc for the RS232 line drivers. Each MAX232 has two line drivers and two line receivers.

The Maxim chip is probably the easiest to use since in only requires a single supply. The MAX232 should be available for less than $5 at Mouser or Digikey. And the tantalum caps are about 25 cents each. In addition to Maxim, Harris and a few other chip makers are second sourcing these devices. Maxim also makes a new version of this chip, the MAX233. Same pinout, but doesn't require the external capacitors. They may be available from the same sources as the MAX232, but don't seem to be as readily available.

The 1488/1489 combo might be easier to locate (maybe an old serial card from an old computer) and also might show up at surplus electronics dealers for less than $1 per chip.

In-out merchants with little time, but also no worry about damaging
things, and no knowledge about what anything is...

Sorry,
David GM4ZNX

Hey, how about car radio type code protection of VCRs, hifi gear etc
operated by tilt-switch ? If you move it, you have to put code in before
it'll work again. Might just bring down the net profitability of the
theft trade if enough units had it....

From: markm@teleport.com
Message-ID: <4i4i7u$mm2@nadine.teleport.com>
Source record: 204668

I've been thinking about purchasing an SGC SG-2000 HF transceiver for maritime mobile use. I need ITU marine HF transceive capability, a general-coverage HF receiver (for marine weatherfax transmissions) and would like HF ham coverage as well; but I really don't want to carry two radios, and the SG-2000 seems to be one of the few units that is type-accepted for marine HF and has ham-band coverage as well.

I have an SGC tuner and am reasonably impressed with its design and construction; but nobody stocks the SG-2000 locally and I'm reluctant to commit myself without some better information.

Anybody got experiences, pros, cons, or alternatives to offer?

Due to the fact that the HT-1000 is a new model, I doubt that you
will find one at a "reasonable price." This unit replaces the MT-1000
which you might find at better prices.
Good Luck,
Bill

> Any opinions?

My old Alinco 570T works great in this manner, and you can probably find one cheap. It doesn't have a backlit DTMF mike, though, but you can change that by using another mike. It's real easy to operate strictly by feel, however, so that really isn't necessary. That's probably a good idea with any radio you may have to operate in the dark. If you can't operate it easily by feel, its controls are laid out poorly. The 570T has a switch on the top that puts it in and out of crossband repeat, no secret codes you have to remember, or odd combinations of keypresses and power cycles.

Neither is more or less efficient under all conditions. It depends on
the feedpoint impedance and design of the components.

From: jones@San-Jose.ate.slb.com
Message-ID: <4i2i1f$mp1@k9.San-Jose.ate.slb.com>
Source record: 204680

A few months ago I purchased an Icom 706, but haven't had a lot of time to use it.

One thing I haven't figured out yet: is there a way to get it to "turn on the carrier" so that I can adjust a manual tuner? The "tune" button seems to only work for auto-tuners (and only ones with "Icom" on the nameplate :-( ).

Plugging in the key and switching to "CW" mode isn't all that convenient, but it is the only way I've found so far.

Clark

From: Jeff Goebel <jgoebel@rrnet.com>
Message-ID: <4i4m41$8oh@news.rrnet.com>
Source record: 204682

I just purchased a Kenwood TH-79a(d) this weekend at a hamfest and have a few questions.

1) Is there any way to scan both Vhf & Uhf at the same time on one band?

2) I was disappointed to discover that the battery could only be charged in the radio--does Kenwood or any one else make a holder for charging. (I don't want to buy a quick charger)

3) I did the expanded RX mod and am wanting to scan 300-400 mhz military air band. How do I choose AM modulation for this band?

4) Can the battery be charged-for how long- or be damaged by having a battery in while running the radio on 13.8 vdc?

I realize that these are simple questions but they don't seem to be answered by the manual.

Thanks for you replys,

Jeff Goebel N0VHB

>Then take this advice, stay away from Barry Electronics!

Actually, go to Barry's to look at and feel the equipment, see what's out
there in person, and then purchase from one of the vastly cheaper
mail-order houses. If you insist on store-front, get a price quote from one
of the above-mail-order houses and demand that Barry's meet the price.

As well, for things with the prices printed on them (e.g. ARRL books),
and for small (<$30) items, the NYC sales tax + subway token is cheaper
than shipping from a mail-order house.

From: dgf@netcom.com
Message-ID: <dgfDo4sJD.54n@netcom.com>
Source record: 204693

I want to build a rechargeable battery for a portable transceiver. My options are either NiCad (a string of "D" type cells) or some kind of Gel Cell arrangement. I'm most concerned about getting maximum energy/weight ratio (inclusive of a charger) and maximum peak current (it will be for a 100W class rig); cost is less important (I'm only building one unit).

Suggestions?

> Thanks Ron

The only way I know of is to buy a Chipswitch. They advertised in ham
magazines. They are out of Santa Rosa, California. I do not know if
they
are still in business.

They sell a replacement microprocessor for the 2600. I found it to be
very
difficult to install correctly. It does open up the unit to 11m, and it
adds more memories.

The 2510 can be modified, but not the 2600. Hence the 2510 tends to be
more popular.

SGC has one, expensive and a bit clunky by amateur standards, but it'll
do what you want. They have a nice matching autotuner (also expensive).
I've heard, but haven't seen, that they have a new control head for their
radio that's much better for amateur use (has a tuning *knob* instead of
buttons).

> without desense or other problems?

A few years ago, there was an unfounded rumor that the Kenwood TH78 could do it, but there is no HT that can do "in- band repeat" operation. Given the fact that it's often difficult to get sufficient isolation with a multi-cavity duplexer, common sense would seem to indicate that with the selectivity most HTs exhibit, in-band repeat operation would be a pipe dream.

If I remember correctly, those were low impedance (8 ohms?) phones with fairly large driver assemblies. The latter is exactly what's needed to withstand the rigors of ham radio. Unfortunately, I think they were also about the same weight as an '89 Hyundai.

Try wearing them for an hour, then measure your height. If you haven't lost half an inch, I'm thinking of a different model. ;)

The Raymond Sarrio Company's Ham Radio WWW site is proud to announce a FREE Ham Radio classified advertising page at http://www.csz.com/sarrio.html.

This new classified section will allow Hams to search for equipement with the help of a search engine--no need to scroll through 100's of listing before you find that special piece of gear. Plus, when you find the gear your interested in, each listing comes with point-and-click e-mail access, direct to the Ham that listed the item.

For those Hams with gear to sell, take note! It is absolutely FREE to list your equipment within Ham Classifieds, and there will be no posting time delays. Your posting will go on-line, in our classified search engine, immediately. All you need do is fill out a simple forms page, and upon its (point-and-click) submission, your "For Sale" advertisement is on-line within 1 hour. I will be purging the classified listing initially about once every month, but that timeline will shorten as our classified numbers go up. Give it a try, and let me know how you like it. 73's Ray

>less w/o the cable.

It isn't that simple. I pulled the hood off my ADMS-1 cable and there are several discrete components inside, including a DIP chip. It is my assumption that this is a TTL converter. Spend the 15 bucks, it would probably cost you more in components and effort to try and make your own cable. I just made a custom interconnect for two (supposedly) DDC compliant products, an STB Video card and an Iiyama monitor--that wouldn't talk to each other. Total cost was over ten bucks for two high density 15 pin d-subs, a double-ended hood, solder, and jumper wires. Not to mention the two electronic component stores I had to visit -- a round trip of over 50 miles, plus my time. My boss would of gladly paid 15 dollars for the same thing delivered to our office door.

>
>The Yaesu newsletter said a clone cable can be made from two stereo 1/8"

Correct. But the radio was designed to do this.

I hope this helps.

3307. Yeasu FT-530 poor tx output??

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-13 00:00:00 UTC
From: Jeff Goebel <jgoebel@rrnet.com>
Message-ID: <4i5c4r$332@news.rrnet.com>
Source record: 204622

I have a Yeasu FT-530 which seems to have very low TX output. With the supplied battery (7.2v 600mah) it puts out 1w on UHF and 2W on VHF. On 13.8v it runs 2 watts UHF and 3 watts VHF.

I wouldn't have noticed so much but I just bought a new TH-79 and it puts out 2+ watts UHF with the supplied 6 volt battery.

Can anyone shed light on this? Any adjustments that I can try?

Thanks,

Jeff Goebel N0VHB

I have a 742 and use the repeat mode rather often. I would be glad
to exchange notes.

My understanding is that the main use of DTSS in repeat mode is
to enable facilitate control. There are two types of repeat mode
available: non-remote repeat and remote controled repeat. In
addition, each of these modes can operate two way repeat or one
way repeat.

If you describe the exact circumstance of your repeat operation, i.e.
what are the signals (far end other party, 742 repeater, near end
remote HT,) and which links you want to protect, I will see what I
would do for the situation and get back to you.

Put the 706 into RTTY or FM or lastly AM mode. All key a dead carrier
when the Mic PTT is pressed. I use FM mostly for tuner adjustments,
although RTTY works just fine. The tuner button is for using ICOM
tuners only.

3335. Wanted: Catalog of used radio gear and specs...

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-13 00:00:00 UTC
From: paul_butterfield@wb.xerox.com
Message-ID: <NEWTNews.826752775.19960.Pbutterf@butter-pc.ess.mc.xerox.com>
Source record: 204650

Does anyone know of an on-line reference or a printed catalog that would give would-be buyers of ham radio gear info on older radios? I am in the market for a 2m all-mode, but currently have no way of knowing what make/models have been manufactured or what the capabilities of a particular model might be. For example, what frequency range, what modes, what power, what sensitivity, what selectivity, what # of memories, repeater splits or not, CTCSS or not, DTMF or not, etc. A book would be fine, but an Internet resource would be even better. Does anyone know of such information?

Signed,
KB2TCG in Fairport, NY
Paul_Butterfield@wb.xerox.com

P.S. STILL LOOKING FOR THAT 2M ALL-MODE...

3336. Icom Delta 1A Information Sought

I am looking for any and all accessories for the old Yaessu FT-101ZD radio including: AM(PB-2040) or FM(PB-2218) plug-in modules, SP-901P external speaker/phone patch, FV-901DM external digital VFO, , FTV-901R transverter, or FL-2100Z amplifier.

If you are intersted in selling or can suggest where I could find these accessories, please send me an E-mail. Equipment does not have to be in working order.

Thanks!

Darryl

3339. Samplex Power Supplies?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-13 00:00:00 UTC
From: cdorn@gpu.srv.ualberta.ca
Message-ID: <4i56t0$19cc@pulp.ucs.ualberta.ca>
Source record: 204654

Hi,
Looking around for a supply for my Icom 745, and have been considering the Astron 20A (16Acontinuous), or the Astron 35A. Is the Astron 20A sufficient for the 745? I know it would be nice to have the 35A supply, but money is a factor. Also, when I was in my local Ham shop they were offering Samplex supplies in addition to the Astrons. Anyone know anything about these supplies. I see that they are made in China, and are less expensive than the Astrons, but are they any good?
Thanks,
Chris VE6RDC

3340. Yaesu FT-11R ... anyone use this radio?

Newsgroup: rec.radio.amateur.equipment

Hello all,
I was wondering if anyone has used or owned the Yaesu FT-11R HT?
Because of the great advice I received from other hams from this newsgroup,
I have decided to get an HT. Had a few questions:
Any significant intermod problems? Batt problems? Can I use an external
mike, antenna, etc?

Thanks for any help!

73's...

In article <313E0427.34EF@trw.com>, alan.raskind@trw.com says...
>Mike,
>
>I (and I'm sure others) would like to hear about experiences regarding
>other HT battery suppliers (both good and bad), starting specifically
>with W&W Associates.
>
>How are their batteries?

I have ordered a CNB-153 clone from W&W after calling both Periphex and them.
It was because I was told their version was 12V 800mAH, and Periphex and
Standard
original are only 600mAH. I asked how they can do it and remain cheapest, the
sales lady told me that they use high quality cells and tried to make good
battery.
I also asked about the texture of the case if it matched with the radio, which
is
dull "textured" greyish metallic, they said it should be same as Standard.
When
I received the battery, it is ONLY 600mAH, I checked the catalog they sent in
the
box, no other models in 12V version. I called and they said they only had
600mAH.
The case is black and did not match, later I found even Standard doesn't
either.
Basically they either lied or confused about the capacity, which ticked me most
then.
I was using a small modified AC adaptor for charging thru the DC socket, the
rubber seal finally fell off and finally lost after I tried to put back a few
times.
I called and was told it could be done under warranty but I had to send it
back, they
cannot send me the rubber piece alone (and I might not be able to put it in
anyway.)

>Case quality and fit?

It doesn't fit Standard well at all, it moves around and I have to put 3 layers
of
masking tape to make it fit better on top of the guide/groves. I have since
dropped
it hard a few times, concrete and all, bottom part is a bit seperate but no big
deal,
though my radio case was broken where it holds the battery. A second pack of
7.2V

1100mAH CNB-152 doesn't fit any better at all. My friend's W&W for his Yaesu FT-530
fits better.

>Life expectancy?

Probably more than 2 years now, the 12V doesn't last very well, but I didn't bother
to test it fully. The 7.2V one has no problems. I think their cells are not too bad.

>Nicad memory?

I knew and read about this when nobody knows, now everyone knows and I now believe it
is greatly exagerrated. There are more serious problems than memory.

>What about their Master Charger I that uses "delta negative voltage
>detection" with the custom charging "cups"?

I bought one and I like it very much. It uses the Philips IC which uses above method, which is by far the most accurate to measure peak capacity detection. And
the replacement cup is good for changing radio.

>Does it work OK?

Amazing it can charge both 7.2V and 12V without any switches. It works very well,
my cellular battery charger is similar but I don't think it is as good as the Philips
IC in that I don't think it can trickle charge after peaked. My Norelco/Philips
electric shaver has the same LED pattern and I suspect they used the same chip.

>Does this charging method help improve the life of the battery?

Yes, it prevents them from being overcharged and yet you get fast charging.

>What about the quality of the cups and chargers themselves?

They fit well, and both well built unit, I like it better than their batteries. It is simple looking but very functional. I usually hate to spend so much for such a "simple" device (which I always thought I could have built it) but since I haven't built one, I have never regretted buying it, if you really want to have
a worry free charger.

>
>Info on any other suppliers?

Not much. Original batteries are expensive but you get better support.
>
>I'm sure that most of us will be very interested in these postings.
>

>Thanks, Alan, WA6AQC

If I were to buy the charger again, I'd buy the MasterCharger I+II or something like that, I just got another HT and I need another charger, the I+II have 2 cups and can rotate being fast and slow on either side, (but not fast on both same time.)

I've had one for several weeks, and am also using it with a TS850S/AT. I'm very pleased with it, and at the time I ordered it, HAL was including a copy of Express 3.5, which is an impressive piece of software and much nicer than the rather clunky software HAL produces itself. I've used it side-by-side with my PK-232 and there is simply no comparison -- the HAL blows it away.

It is a pain to wire the 13-pin ACC2 plug, especially since the pins are so closely spaced. I took the lazy way out and ordered a PK-232/TS850 cable from AES (which has the ACC2 plug on one end). I whacked it off about 8 inches from the connector, wired up the leads to one side of a terminal block, wired the cables from the P-38 to the other and was up and running in only a few minutes. (The connectors on the P-38 end are just 3 phono plugs and one Sony mini-plug.)

The only thing you could do better by wiring the connector yourself is to use the standby pin that cuts out the front-panel microphone connector when in transmit as opposed to the generic standby pin that is wired in the cable AES sells. This is not an issue when the radio is in FSK mode, since the front-panel microphone connector isn't active in this mode anyway. It's only an issue if you run AFSK, which you must do for Clover. All the other modes may be run in straight FSK. Of course, you can also simply unplug the microphone :-).

3348. Subject: IC-W31A Opinions Sought

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-13 00:00:00 UTC
From: aust@gandalf.sp.TRw.COM
Message-ID: <9603131541.AA04237@shelob>
Source record: 204703

Jack,
I just got an Icom W31A and it a real great radio on UHF. It has
great sensitivity on UHF receive from 410-512Mhz with no image responses
like I found in the Kenwood TH78A.
I got my TH79A(D) to receice above 470Mhz, but it has images like the TH78A
and gets real deaf above 500Mhz.
Also I was really considering the FT51R, but signals fro 480- 512 Mhz were
much stronger, and I was impressed. It was more sensitive than my Commerical
Bendix-King handheld I use in the 512 region for Reserve and Search & Rescue
operations.
Icom really did wonders on the out of band receive on the W31A!!
I can hear the National Weather Service UHF links at 410Mhz great
60 miles away, Forestry links 100miles away at 415Mhz, 486Mhz , 512Mhz
were just as sensitive as in band 440-450MHz.

Comparing this to the FT51R, I had to put a 5/8 long whip to hear the
same signal about S1(with images), but with a mini-duck antenna on the W31A,
the signals were S9-S10 (no images).
I suspect with the FT51R, that the image frequency causes the RF to IF
noise figure to be 3 db higher. The thermal noise from thehigh gain front
end causes USB and LSB noise floors to fold into the same IF. The sensitivity
is best in the 440-450Mhz band.
With the Icom W31A, I note the same sensitivity across the 400-530Mhz range.
Next I took a signal generator to both units and injected a sigal at the
image when listening to the Ft51R, in the case of the W31A, the level of the
generator has to be raised about 30dB before it was detected, whereas in the
FT51R, it was easy to detect.
I guess you could say the RF to IF noise figure is much better on the
Icom W31A, compared to the Yaesu FT51R on UHF. I really like the scanning
PL-decode feature on the W31A.
I hope this helps you Jack.

An MLG1003A is a UHF amp for the first stage of a Motorola microwave radio such as the MR600 6 GHz terminal. Is it a brown thing (just looks like abig heat sink) about 10x6x1.5 inches (about?). The MLG100x takes a 600 to 750 MHz input at about 450mw from an oscillator and amplifies it to about 12 to 15 watts.

Then you have a MU594. Which is not one I am familiar with, but hey, the number is close to MU591. The 591 is a 2 GHz multiplier. It takes the ~700 MHz signal at 12 to 15 watts from the MLG1003 and triples it to the 2 GHz range. The output of the 2 GHz tripler is about 6 watts.

On the 6 GHz system, another multiplier such as the MLN1002 will take the 6 watt, 2 GHz signal from the previous tripler and triple it again to the 6 GHz range at about 1 watt. From there it goes to the waveguide.

Motorola made an MR-200 2 GHz terminal that just didn't use the second tripler. The output of the 2 GHz tripler was padded down to just a couples of watts before it went to the antenna. The MU594 may have come from that radio. I have never worked on an MR-200.

I have some documentation on the 1003 but I have to look for it.

3350. TS-450 BC band sensitivity mod?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-13 00:00:00 UTC
From: chipa@eskimo.com
Message-ID: <Do7w4C.66H@eskimo.com>
Source record: 204705

Is there a mod, similar to that available for the TS-850, to increase
broadcast band (.5 to 1.7 MHz) sensitivity in the 450? Alternatively,
does anyone know how the sensitivity (in that freq. range) of the
Icom 706 compares to the Kenwoods (modified or otherwise)?

The goal here is decent NAVTEX reception (518 KHz).

Please reply by email, as posts take up to a week to arrive here. Thanks...

From: killian@aztec.asu.edu
Message-ID: <4i74cg$enr@news.asu.edu>
Source record: 204706

I have an FT-11R and a VC-22 VOX headset. Does anyone know of a way to get "some type" of audio feedback to the earpiece when the VOX is keyed? Sometimes I find that the gain is not high enough and without looking at the LED I can't tell that I am dropping out.

My kids have a set of Radio Shack VOX 49 Mhz headsets and that design actually echos (at very low volume) your speech.

For me, just about anything will do, even a low tone or click or something.

Thanks
Mike

>period of time, but for the most part the battery is "floated" at
>13.8v.

That's true of automotive starting batteries, but there also exist
deep cycle marine and traction batteries which are much more tolerant
of deep discharge. And there's the Edison cell (lead-iron chemistry)
which the phone company has been using forever for plant power.

>Nicads, if you believe in the memory effect, work best if
>the application drains them almost completely and then they are
>recharged completely.

Memory effect is mostly myth. It can only occur under very special
conditions, conditions no amateur is ever likely to encounter. A
different effect, sometimes mistakenly called memory, but correctly
termed voltage depression, can result from *overcharging* NiCad
batteries. If you don't have a smart NiCad charger, that's easy
to do with a straight timed charger unless you know the state of
charge of the battery before commencing charging. One way to know
the state of charge is to fully discharge the cells first, but
you have to be very very careful about doing this to NiCad *packs*
since you can easily reverse a cell due to the weakest cell in
the pack becoming fully discharged first. Reversing a cell will
certainly damage the pack.

>One shouldn't float Nicads like you do with
>lead acids. If I remember correctly, the handbook indicates that
>Nicads have 10 times the number of full discharge cycles vs. lead
>acid.

The typical number of full charge-discharge cycles for a NiCad cell
is around 500, more if only partial charge-discharge cycles are used.
Due to inefficiencies in the chemistry, some amount of ultimate
capacity is lost every time you cycle the chemicals. The total
number of amp-hrs you can get from a cell is roughly 500*A where
A is the cell's amp-hr rating. You can do that with a relatively
few full cycles, or a bunch of partial cycles.

Another chemistry with better capacity/mass is NimH, such as is
used in newer laptop computers and handheld cellular phones. These

cells too require fairly special charging and discharging to achieve maximum life. They are more costly than NiCads at present, and NiCads are in turn more costly than lead-acid batteries of equal capacity. If you need bulk storage cheap, lead-acid or lead-iron remain the way to go. If you must have minimum weight for a given capacity, regardless of cost or complexity, then NimH is the way to go.

But if capacity/mass is the overriding concern, then you must turn to primary cells such as the ordinary alkaline cells, the newer lithium cells, or to zinc-air batteries.

>Thanks,
>Chris VE6RDC

I've used a RS-20A with a IC745. It works, but it is marginal. The peak current draw of the radio exceeds the peak rated output of the supply by about 10%. This may cause slight distortion on voice peaks, though I got away with doing it, probably thanks to Astron's ratings being somewhat conservative. The RS-35A is better because of the reserve peak current capacity it offers. The RS-20A isn't going to overheat or fail due to slightly exceeding its rated peak current, however, because the IC-745 draws much less *average* current (about 1/8th of peak without speech compression) than 16 amps.

I don't know anything about the Samplex supplies.

A freind of mine wants to measure the field produced by power lines at a house he is thinking about buying. Does anybody have a gauss meter that could be used for this purpose? How does one check/calibrate such a device?

Soldering aluminum is tricky, you need to tin it under oil first
before attempting to join it to the copper. This isn't too hard
with a chassis plate, but it is harder with a wire. Use clamps
instead, or try the antenna I'm going to describe below.

This antenna is called a coaxial sleeve dipole, and all you need
to make it is a length of coax. Take a length of coax and strip
off the outer jacket for about 19.5 inches from one end. Push back
on the braid to loosen it from the inner insulation (like Chinese
thumbcuffs). Now roll the braid back over the cable like a sock
so that you wind up with 19.5 inches of exposed inner conductor and
19 inches of braid extending back over the cable's outer jacket.
Strip about an inch of inner insulation off the end of the cable and
form the inner conductor into a loop. This is the antenna "mount",
hang it up using some string to any high point within convienent
reach. Put a connector on the other end of the cable and connect
it to your radio. You're done. It doesn't get much simpler than
this.

You may need to cut the outer insulation a bit further back than
19.5 inches in order to wind up with a "sleeve" 19 inches long
over the cable. This will vary a bit depending on the particular
cable you use. Feel free to experiment. Trim the exposed inner
for about 19 inches (or best VSWR if you care), if it winds up
too long. It will, the dielectric will electrically lengthen
it. One way to "shorten" the antenna for best VSWR is to just
start trimming off sections of inner insulation. This is better
than snipping the wire back because it maintains physical balance
of the antenna "elements".

The Alternator and the Generator have Carbon Brushes
The fundamental differences are in the winding to brush interface. The DC Generator has commutator segments (individual slip sections) while the alternator has smooth continuous slip rings. The alternator has a diode configuration accross the output to provide DC vs the AC produced by the alternator.

A word to the wise concerning brush replacement: If you are running a transmitter in your vehicle check the alternator for excessive brush wear on

an annual basis. Improper brush seating and high current load will cause brush pitting, and with pitting will come arcing, and with arcing come electrical noise.

3368. Need help programming an IC-U200

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-14 00:00:00 UTC
From: Michael Brown <mbrown@lilly.com>
Message-ID: <31488975.1557@lilly.com>
Source record: 204523

I bought an Icom IC-U200 land mobile radio at the hamfest last weekend, and I need some help programming it. The owner said that the only way he knew to program it was with the radio's "brother" handheld. I guess you take some data signal out of the handheld and pipe it into the 5 pin mic plug on the mobile.

Does anyone have a U200 and have programmed it? Icom will program it for me, but for $65!

Please respond through email...

>decided to use them anyway since I've had reasonably good luck with Sanyo
>cells (although I do think there are better products on the market), but
>after I got them soldered together I noticed they were only rated at 200 mAH
>rather than 250 mAH; which is the rating of Sanyo's current AAA cells.
[rest of story deleted]
>
> Greg

When I ordered my pack for my Standard HT, I was told it's 12V 800mAH, and I confirmed w/ the W&W sales staff again (by asking them how they can do it while their competition is only 600mAH). It arrived as rated 600mAH on the case. When I called them, they said they had no 800mAH version. So what was that I was told?

Read the rest of the story in my other post 2 days ago.

So now this confirmed they lied to their customers, at least twice by now. Strangely I really like their charger though :).

So, caveat emptor!

David

Intermod seems to be better than average, but can still get you. Battery
problems? Not any caused by the radio. I have a hot rod, and I know
people who've used mag-mounts successfully with theirs. I have yet to get
a external speaker/mike, but may do that soon.

> I love mine. It is probably the 6th or 7th HT I have owned and by far

Yes, I like mine too. However, before you buy make sure the *particular*
FT-11R you buy doesn't have excessive CTCSS modulation. This is a problem
for some series of them, and not others (I am waiting for a service bulletin
from Yeasu). Have someone transmit using the FT-11R with and without the
tone turned on. If you hear a hum, it's too loud (it should be sub-audible
by definition). If you buy the optional CTCSS decode board, you will be
able to adjust the modulation.

> It has a lot of functions and you will simplify your life greatly if
> you spring for the ADMS-1 computor inerface.

Don't do this unless you have a computer! :-) Personally, having a computer
at home would cause more problems than programming my HT.

Unless you really need the aircraft recieve of the ft-11, I would say you should be looking at the ft-10. It has encode and decode of ctcss and man other cool options such as a voice recorder that can be set to record automatically after a page and respond with a prerecorded message etc. There are just tons more features in the ft-10, some of which can be had on an ft-11 as options, but that will make the ft-11 cost even more. As it is now, the ft-10 is about $20-$30 cheaper where I have seen it, and it has more than the ft-11 for that price. Oh, forgot the ft-10 is also the first amateur HT to have a mil spec rating.

Just my 3 cents worth

Josh

Sometimes, Ross, but usually they, or the slip rings, are chewed
up, and they arc like mad. Of course then you have a spark transmitter,
and it will produce the hash the poster was reporting. This is *not*
the source of alternator "whine", but the poster didn't report whine.

I torn the alternator in my Ford F100 down and rebuilt it a few years ago. (What I'm trying to say is that my experience is not broad, but deep :). There are certainly a pair of brushes in there, carrying current for the exciter winding (the winding on the rotor). But that's a DC winding so I wouldn't expect it to contribute a whine, rather a hiss *if* that was the problem. Bypassing the brushes with small value disc ceramics should quiet the noise.

I finally tried to use this radio for the first time last night and check in with the local ARES net. The net controller said I was not opening the repeater (15 miles). I'm using the EBP-10N which is 7.2 volts and gives me 0.2 watt out.

The manual says using the EBP-12N battery (12 volts) will give me 2 watts out in "Low" or 5 watts out in "High."

My question is: Can I use a 12 volt power supply and just connect that to the DC "in" jack. Wouldn't this allow my to transmit with the full 5 watts?

Also, I'm using a rubber duck antenna. The calculations I made for 147.585 (local chat) for making a simply dipole is a piece of wire 38 inches long, fed 19" from either end. I have some #8 aluminum ground wire left over from grounding my Antron. Would that be ok?

When feeding this wire does it make any difference how far the ground and center conductor are spaced apart? I mean where they are soldered to the aluminum wire?

Thanks,

Doug

>check/calibrate such a device?

The one I used to have was about 2.5" in diameter and about 3/4"
thick, with a glass lens. It looked somewhat like an automotive
meter, the type they used to sell to measure engine compression.

Anyway, it was self-contained, completely passive, and extremely
sensitive. I don't know exactly how they work, but the needle must
have been magnetic, like a compass. In the one I had, there was no
obvious means of calibration.

Sorry, it's been about 8 years since I had it and I don't remember who
the manufacturer was.

I own a cheap General Electric boombox (about a $100 in value) that is a few years old. It works well but when I am on a certain FM channel listening to my favourite station, I intermittenly pickup actual radio transmissions from overhead commercial airliners. These are actual commercial airline communiques to the tower and back. I know it is because the pilot states the airline and other info. like heading and other number jumbo stuff. This is a simple radio with no short wave or any extra bells or whistles and it works well except for the fact that every so often it interupts the music and I hear aircraft communication messages. Does anyone have any idea what causes this? I thought Commerical Airline bands were totally different and not even close to the FM bands.

Thanks greatly!

Peter

Quite obvious what's going on here. This is a classic case of "image"
reception.

Suppose your FM radio is tuned to 100.3 MHz. Inside the radio, the local
oscillator runs at 10.7Mhz above what station you are picking up, in this
case it would be 111.0Mhz. When you mix the two signals together, one of
the things you get is the difference of the two signals, or 10.7Mhz. The
radio is tuned to amplify and detect 10.7Mhz.

Remember that the oscillator is running at 111.0Mhz, suppose an aircraft
transmits on 111.0+10.7 = 121.7, the difference between these two is also
10.7 and the radio can also demodulate this.

So your FM radio is capable of receiving signals which are 21.4 Mhz above
the dial setting of 88-108, (119.4-139.4), these frequencies are mostly
used by aircraft. However, the front end of the radio is supposed to
tune out these frequencies, so the aircraft signal has to be pretty
strong for you to pick it up.

Most, if not all, scanners (unmodified) can receive cellular frequencies
through a similar technique. Even though they cannot tune cell freqs.
directly, it is normally easy to find another frequency outside the cell
band which will allow them to be picked up.

> OK. How do you get rid of whine?
>
> Chuck, KE9UWUsually alternator whine can be cleared up by installing an inline choke in the power lead to the radio. However I think the original poster reported he had a 700 watt transmitter which means the choke would have to be able to carry 50 or more amps without excessive voltage drop. Maybe in this case the receiver DC input can be seperated from the PA and can be filtered with a hotline filter.

The power cable must be of sufficient size and run directly to the battery posts.
Sometimes alternator whine increases as the vehicles battery ages and can be eliminated by replacment of the battery.

3396. Diplexor for 80-10 and 6 meters

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-15 00:00:00 UTC
From: Carl Estey <carl.estey@HBC.Honeywell.com>
Message-ID: <31497353.683E@HBC.Honeywell.com>
Source record: 204546

Some time ago I scanned a message that mentioned a device (diplexor or duplexor?) that lets you connect seperate 80/10 and 6-meter antennas to one input/output of a radio. Such devices are common for VHF/UHF but uncommon for 6 and 80-10 meters. Can anyone tell me who makes this device? Cost and model would be helpful too.

The specific application is the ICOM IC-706 which has on SO-239 connection that services 80 - 10 meters AND 6 meters. I would like to divide this for use with one antenna on 80-10 and another for 6-meters. Fortunately, Icom did provide a seperate connector for 2-meters!

3400. Tempo MPP-1 Printing TNC

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-15 00:00:00 UTC
From: sparkfel@primenet.com
Message-ID: <3149f02c.1288430@news.primenet.com>
Source record: 204550

I recently aquired a Tempo MPP-1 TNC and am interested in starting a dialog with any other Tempo/AR1200 owners.

Specifically, I am looking for the 5-pin Mini-DIN-like TNC to radio connector. A call to Henry Radio was of little help as they no longer distribute the unit, nor do they have any more cables. I have been able to find the female part of this connector locally. but no one has ever seen a cable like this that I can find in the Phoenix area. Does anyone know of a supplier for these connectors?

Also, I only have the basic manual and would gladly pay a small fee for a copy of the technical manual/schematic. Even a complete breakdown of the MPP-1's unique commands would be helpful.

I am aware of the birdie this unit causes on 145.01. I'm aware there is a cure, but what is it?

I understand the 80 mm paper rolls are difficult and expensive to find. Does anyone know of a good supplier for this paper? I'm also aware, as I used to work in a print shop, that it is quite possible to buy wider thermal paper rolls and cut them down with a band saw. Has anyone done this?

Generally, I am interested in any tidbits, dirt, amusing anecdotes, unusual uses, etc. of the Tempo MPP-1/AR1200.

Please respond via personal e-mail.

Mark:

We have an SGC-2000 aboard the SS Lane Victory (a WWII Victory ship that
has been turned over to the US Merchant Marine Veterans of WWII and is
now a fully operational ship/museum/memorial berthed in San Pedro, CA).

The radio is basically OK for commercial type communications, that is,
where you can select channels. Its interface is pretty awkward for ham
radio type operations, where you really need a knob that you can turn to
change frequenies. The general human interface is pretty bad, in the
sense that the main controls are through two buttons, one with an up
arrow and the other with a down arrow. Normally these control volumne,
but they also can be used to change frequencies, etc. There is no
indication of the mode of the these buttons; it is real easy to get
confused about what will happen if you push one.

If you intend to use the radio for CW, it is very awkward because you
have to manually calculate and enter the transmitting offset frequency.
Just about every ham radio I know of does this internally. If you connect
a key through the key connection in the back of the radio, no side tone
is generated; if you want to hear a side tone, you have to connect the
key in parallel with the PTT switch on the microphone.

Reliablility of the radio has been, in my opinion, pretty mediocre. We
had to replace the cpu soon after we got the radio and found several
intermittent solder bridges in one of the internal connectors. Right now
buttons 6 through 9 on the keypad sometimes work and sometimes don't
(they are all on one bus of a matrix). Also the internal battery is dead;

this is the second one and the radio is only 2 years old.

Also, be sure to get a good husky power supply. We are using an ASTRON 35 Amp supply and find that it is marginal when the radio is tuned to frequencies around the 80-meter ham band (i.e. around 4 MHz)

On the otherhand, the SGC tuner seems to work fine.

From: Carl Estey <carl.estey@HBC.Honeywell.com>
Message-ID: <314974AD.63E3@HBC.Honeywell.com>
Source record: 204556

I have attempted to program in plus and minus offsets for repeaters in the manner that the Icom IC-706 manual advises but either my radio is broken, or the software is broken or I can't read!

The only way I have been able to program the offsets is to use VFO A and B and the split mode. Just setting -600 in the offset setup doesn't seem to work.

Am I doing something wrong ... or did Icom start the offset programming and not fully implement it?

Hi Jack, Additionally, it's difficult for me to see how an operating position antenna tuner could possibly be more efficient than a reactance properly placed on the transmission line to completely eliminate reflections between that point and the transmitter. IMO, properly placed parallel or series reactances are always equal to or better than a conventional antenna tuner. Furthermore, those reactances can usually be placed at the operating position thus completely eliminating the conventional antenna tuner.

Help!!

I've just picked up a Heathkit HW-101, but no manual.

Can someone email a quick paragraph of tuneup instructions?

EG: 1. Peak Preselector
2. Grid current to xxx
3. Plate to
4. Tune plate for max out
5. Audio gain til yyy on alc meter

ETC.

It would help me put the thing on the air.

Thanks,
Jeff

> VLV8987

You need to get a marine radio, since generally speaking their tech specifications are somewhat more exacting than amateur gear. Various international and national rules specify what marine rigs must do in order to qualify for service. Those rules are always more stringent than amateur radio rules.

If you have a valid amateur license (a MUST), you may then operate your marine ssb rig on the ham bands without difficulty, provided such use does not violate any watch-keeping regulations.

While most newer ham rigs WILL work on the marine bands (usually with a simple modification), such a practice is not recommended, except in cases of distress.

Look into radios from Skanti (SAIT) for marine ssb. They are very well built and effective. Furuno also makes a good unit. You can expect to pay in the neighborhood of 10,000 USD for one, substantially less for used.

Happy sailing!

I probably won't know the exact answer due to your location not being in my area! However, are you in the proximity of an AGA (Air-Ground-Air) station, used by Air Traffic Control for AGA communication? If so then it is simple breakthrough, as we tend to use quite high powers.

If you do not then I would put the radio up for auction, or patent it!

They are heavy, but I use them for my setup, and prefer them to the lighter weight headsets because the also function as a set of hearing protectors, doing an excellent job of cutting down background noise. I used to use them for listening to the stereo, so I guess I got used to them. What I would like to know is if there is a matching microphone assembly that can be purchased either new or used (anybody got one they would like to sell?) There is a removeable aluminum finger nut on one of the earphone shells that looks like it was designed for that purpose.

.....the telcomms act authorizes the FCC to license recreational marine radios by rule. The FCC will probably act on this very soon. What this means is that recreational boaters will no longer need a license to operate a radio in the HF and VHF marine bands. You will still need a license, though, to operate in the Ham bands.

The number worked from the San Francisco area the same day as the
original post. It went to what I think was a voice pager
number--message time was about 30 seconds. I had to leave two messages
because I was specific about what I was looking...BEEEEP. Anyway, I
haven't heard anything back.

He may have disconnected the number after being flooded with pager
messages, which he probably has to pay for. Give spam, get spam.

There are *lots* of ways radios can respond to unwanteds. My guess is
that the FM frequency subtracted from the the airband frequency yields
a number that would waltz its way straight through the IF circuits in your
GE "boombox". You have something causing a non-linearity to allow mixing
distortion of this kind. A corroded connection.. a strong out of band signal
driving the GE front end too far...etc.

A bandpass front end filter would probably cure it.

Oh, heck, I'm not suggesting for a minute that bypassing the brushes is a the proper repair for worn or pitted brushes and/or sliprings. The fix for worn out parts is of course new parts. And the first course of action is to tear down and inspect. I don't like bandaid repairs (except to get back home, of course.) I was speaking in an assumed (and I should have made it explicit) context of a properly maintained alternator being RF noisy, probably due to inherently poor design.

Date: 1996-03-15 00:00:00 UTC
From: dubner@spk.hp.com
Message-ID: <4icjog$8vg@hpcvsnz.cv.hp.com>
Source record: 204579

Earlier I wrote:
: My Kenwood TS-820S came with a pair of S2001 tubes in the final. They
: look suspiciously like 6146s. What's the difference -- anyone know?

Thanks to all who replied. The general opinion was that they were more-or-less equivalent, depending on which 6146 (6146A, 6146B, or 6146W) one was comparing to. Some pointed out minor differences in base size and perhaps plate dissipation.

The definitive response came from Itaru Okada, JF2NXS / N7UVV, okada@decst.nipr.ac.jp, who wrote me:

The differences between 6146 and S2001, which I know, are the heater current and the maximum surface temprerature. So you cannot use them together in the case of series heater circuit.

The permitted maximum surface temperature of 6146 is 260 degree C, and that of S2001 is 220 degree C (data from the Yaesu musen journal, No.1). S2001 is japanese copy of 6146, and was made by Matsushita (Panasonic).

Thanks again to one and all.

I have the FT51R and my son has the FT530. I prefer the 51 because it is simpler to operate, has an alphanumeric memory display and all the options are easily setable. The 530 has many more options like a clock display and programable power off and on, but you need the manual to change those settings you do not use often.

As for the power, I have both the small and the large (5W) batteries. Most of the time, I use the small battery. The diffrence in power is not so apparent but the difference in weight and size is.

Well, it depends what you call a good vertical.

it is quite expensive and looks impressive, However, performance
is similar to a dummy load. It is easily beat by a dipole at the same
height.

A good vertical comes with a ground plane.

Anyone,

I am coming over to Australia (Sydney) in may and i'm after as much

info on freq's and repeater outputs as i can get.

Also are the prices comparable as England? Should i buy over here and
take with me or should i buy in AUS???

I have an FT-411E for sale. It is in mint condition, having recently been sent to the factory for a new speaker/mike jack...came back looking like they sent me a new radio! Must sell it to pay for some other recently purchased gear. Accessories include 3 battery packs (FNB-11, FNB-14, FNB-10), PA-6 mobile DC adapter, and NC-29 desk quick charger. I paid over $630 new for all this....asking $375, but will consider reasonable offers.
This radio works great, no problems...also has all mods for extended RX/TX.
Oh yeah, and a soft case too! -Gerry

Commercial airline frequencies are just above the statndard FM
broadcast band. Your radio probably has a "cheap" tuner that
doesn't just zero in on the desired frequency, but is subject to
interference on nearby frequencies when a transmitter operating on
those nearby frequencies is nearby (gee...how many more times could
I squeeze the word "nearby" into that sentence?).

What's happening is your radio is probably tuned to an FM station
near the upper end of the band (around 107-108mhz) and you're
probably under a flight path. When a plane is nearby (there's
that word again) and the pilot transmits on one of the lower
airline frequencies, your radio's less than discriminating tuner
picks it up.

Source record: 204469

I just bought my ft-530.. I did the green wire mod... I worked fine.. I got extended UFH and it claimed 800-950.. But I put it next to a scanner and the radio didn't pick up the signals the scanner did. But...
That night the memory got erased and now I have 110-174 rx 144-148 tx and normal UHF stuff.. I went back into it and chacked pad 13 and the resister (0 ohm) on pad 15.. Both were fine..
I tried the up & down arrow thing again. (several times) and holding MR and VFO while turning it on..

Somebody said that this mod toggled.. Is this true? Did I un-toggle it?
If so can I turn it back on??
Thanks...

Whilst that is very feasible, due to the low powers transmitted by
aircraft (RX levels of the order of less than -90dBm even with the sorts
of aerials and masts etc., that we use in the CAA !) then I would
imagaine that the aircraft must be relatively low when overflying his
property to cause these signals to be strong enough to swamp the radio.

Peter Neidhardt (petern@terraport.net) penned:
: I own a cheap General Electric boombox (about a $100 in value) that is a
: few years old. It works well but when I am on a certain FM channel
: listening to my favourite station, I intermittenly pickup actual radio
: transmissions from overhead commercial airliners. These are actual
: commercial airline communiques to the tower and back. I know it is
: because the pilot states the airline and other info. like heading and
: other number jumbo stuff. This is a simple radio with no short wave or
: any extra bells or whistles and it works well except for the fact that
: every so often it interupts the music and I hear aircraft communication
: messages. Does anyone have any idea what causes this? I thought
: Commerical Airline bands were totally different and not even close to the
: FM bands.

: Thanks greatly!
: Peter

Commercial airline freqs are right above the FM band. Your radio is receiving an image freq and detecting it even to it's AM and not FM. The airplane is probably really close, maybe overhead.

Image freqs work something like this. The IF of the radio is 10.7 MHz, but let's just use 10 MHz. The radio station is at 100 MHz. The IF is 10, so the local oscillator is at 110 MHz. The receiver can receive at both the sum and difference of the two, so it can receive at either 100 MHz or 120 MHz. The 120 MHz is (somewhat) tuned out by the receiver's tuned circuits leaving the 100 MHz. But sometimnes the receiver doesn't do the tuning too well. And sometimes the unwanted transmitter is real close, so it gets thru anyway.

If youre using the built-in rabbit ears, make sure they are fully extended. If you are always in a certain area, the location may be affecting the reception of your fav FM station, so try to maximize the signal by changing the location. You could also try reducing the signal strength by putting the antenna in the collapsed position. Maybe one of these might help enough to eliminate your problem.

Another boombox might help, too. I bought some cheap soundesign radio in a bargain pack along with a flashlight and some batteries. I liked it because it received both FM and TV. But the receiver is atrocious, and receives all sorts of images of who knows what. It really sucks, but what can one expect when buying a radio and flashlight with batteries for twenty bucks? Not much, I guess. The Renewal batteries suck, too. They try to nail you later for the cost of the recharger! Forget it.

What you are hearing is on the image frequency. Your superhetrodyne receiver has an oscillator 10.7 MHz above the receive frequency. The radio also picks up signals that are 10.7 above the oscillator. or 21.4 MHz above the intended FM frequency. Aircraft operate in the 118 to 136 MHz range.

Icom is marketing the IC-706 to the Marine market. They have a
package that includes a single-ended antenna tuner for vessel.
I presume it is all legal, and as far as I can tell it is the same
as the amateur model.

I dont know about a 6146 with no suffix, but the 6146B is rated at
higher operating voltage and current than the 6146A. They are
interchangable insofar as a "B" could always replace an "A", but an "A"
might require lowering the plate and screen voltage.

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Would like to get some opinions as to how this rig stacks up against the other radios in its price class.. like the FT-990 or the TS-850. I would kinda like to support an US made product, as long as to compares favorably with the competition.

Alan,
I have been using W&W batteries for several models and brands of
radios for several years now and other than the case finish, I like
them and have had very good luck with them. I have also used their
Master Charger 1 for quite awhile and like it also. I use their
charger for HT's that a 12 volt rapid charger is not available for.
This is great when you are out working ARES or SARC as you don't
usually have the comfort of house current for most rapid chargers.
Good Luck with them
Bill

Check Feb 1993 QST, pages 37-41 for an interface diagram and pinouts
for the control connector.

Since the '757 only accepts data (frequency), and doesn't report
anything back, I never did build the thing. So, I can't vouch for
performance, etc.

Good luck!

>Remove D8 Chip diode on logic unit. This opens up TX. Factory
>Rx is 118-174.

I actually tried this mod. Remove the front panel (remove the two
allen head screws, and pull the front panel straight out). D8 is
located near the bottom left of the PCB, next to the silkscreening
for 'W1' and 'D9'. D8 is the lone SMD diode near them.

Remove the diode. Re-install the front panel. The radio does
not require a reset, and will only transmit over the range
it receives FM.

>Commerical Airline bands were totally different and not even close to
the
>FM bands.

You are receiving civilian air comms on the image frequency of your FM RX. The civ air band is 108-136 MHz. Your FM RX tunes 88-108 and probably uses a LO at (88->108)+ 10.7 MHz to convert down to an IF at approximately 10.7 MHz. This means that strong air signals at approximately 2*10.7=21.4 MHz above the tuned FM band frequency will come in. Your radio is an FM RX, the air comms are AM, so audio may be distorted or noisy. Example...if a local tower uses say 120.1 MHz, you might hear it at about 98.7.

3480. Donations of 2-meter Rigs Needed.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-17 00:00:00 UTC
From: rshort@whidbey.com
Message-ID: <4ii4rh$ivf@whidbey.whidbey.com>
Source record: 204480

We need about twelve 2-meter transceivers for use on the Island County (Washington State) ARES/RACES emergency service packet network that is under construction. We can use 10 watt or better
rigs that are crystal controlled and do not have the sub-audible tone capability as well, of course, as the
newer xmtrs. Donations of equipment for this purpose gladly accepted. I'll personally pick up in the Pugent
Sound and surrounding communities.

Many Thanks and 73's

Ron Short

ok, heres the story,
A friend and i built the "FM-25" yesterday. We turned it on and nothing.. So we looked at the troubleshooting guide, "check all the capacatators for correct poplaraty" so well what do you know i fucked up on C4. So i re did c4 which is a 10uF ec. tried it again, it worked! After a little while of use (1 hour) is just stoped. no nothing, just static. I was prety MAD. So i took a lot at the PCB, it looked fine, no bridges or anything. My friend lookd at it and held it in her hand.. It suddnelt worked again. After this i set it up again to play some music from my walkman while listinging from my stero system in my room. after the fm-25 stoped working again is was ovious something is really fucked up with it.. but it was geting late and she had to go home. So today i was resoddering all the parts to see if i could fix the problem...
It works again. Ok this is good, then it fucked up again! Dam i was pissed. so i started touching the underside of the PCB, where all the soddering connections are. it still wasnet working. Even though the light for "freqency LOCK" was on the transmiter wan't working. before the led would just be off.

i also have this problem geting stero on the fm-25 before the unit completly broke. any ideas?

Well im having trouble , should i send it in to be repaired for $36? Or just send in the BA1404 and the program IC's to see if there fucked up? i dono. well if you have any suggestions please e-mail me at critta66@shadow.net.

Thanx in advance

PS i can be reached on IRC (undernet) on #god or #troy

> billh@getnet.com

The IF-10C is nothing more than two ICs that go into existing sockets inside the radio. The types required are an 8251A and a 4040 and both should be fairly easy to find. (The 8251A will be harder because there isn't much call for 8250 UARTs like it any more.)

Apart from the ICs, you will also need to buy or build an external level translator like the Kenwood IF-232C. for more info on this, check the Kentrol Web pages.

: E-Mail: carl.estey@HBC.Honeywell.com or wa0cqg@wa0cqg-uhf.ampr.org
: (TCP/IP)

I just got mine this weekend so I might be missing something but I just
bring up the 2m freq in the main VFO, go to menu M1 and _hold down_ the SPL
(F1) key until it beeps. You can check your TX freq by going to
menu G3 and reading the TX freq on that line. As you mention, you do have
to set the -600 offset in initial setup mode, although that is a default
on my radio. I found this on page 28 (Repeater operation) item 4 of the
owners manual.

Now I have a return question: Does your radio have a 15Khz TS rate? Mine
goes from 12.5 to 20Khz, skipping 15.

Hope that gets you fixed up.

In order to split the HF / 6-m signals from the common coax connector on the IC-706, and many similar rigs, buy the CF-360 from Comet. It has essentially no loss, and claims to handle 500 W. Costs about $70. There are two versions, which differ only in which ports have male or female connectors.

I bought one of those three years ago. Of course, I didn't realize what a jewel I had until the tape transport broke a month later. Funny, the outside said AT&T, but the inside said China.

Quality or no, its becoming very difficult to find non-Chinese products in many stores. I think the Chinese economy is going to bury us.

I seem to remember a way of modifying an Icom 2AT for simplex in the 141-150 Mhz range. I love my -2AT's and would like to use them for CAP simplex.

Is my memory failing?

Thanks folks.

I have a Vibroflex Brass Racer and it is sending dit-dahs instead of just dits (the dahs are ok). I replaced the battery a month or so ago, and it is still 7 volts, so does anyone have any other ideas? It seems to happen after about ten minutes of operation. Thanks
norm@cqg.com

3518. Best Rig for SWL and Ham?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-18 00:00:00 UTC
From: cdorn@gpu.srv.ualberta.ca
Message-ID: <4ik522$fu8@pulp.ucs.ualberta.ca>
Source record: 204370

Hi,
I am a relatively new Ham, and I still spend much of my time SWL as
well as Hamming. I am wondering from the broad array of rigs that offer
general coverage, if there are rigs that really pay attention to the
needs of the avid SWL. I am thinking particularly in the areas of
selection of AM bandwidth filters, and RX audio quality. If one had to
choose one rig to meet the needs of the SWL and Ham what would it be?
Interested in your opinions.
Thanks very much,
Chris VE6RDC

From: boardman@cobra.unm.edu
Message-ID: <4iksh8$5hv@lynx.unm.edu>
Source record: 204380

This weekend I adopted an old Icom IC-211 2 meter all mode that needed a new home (The original owner having bought one of those fancy new Kenwood 144/220/440 tribanders). It seems to be a very solid older reg, with very good intermod rejection, but it would be nice to also be able to use it on a few of the local repeaters that require tones. Is there any easy and/or relatively inexpensive way to add PL tones to this rig?

I generally reserve my amorous rutting for animate female humans, so I'm stumped on this one. Maybe if you clean up all the sticky stuff you squirted into your device at the culmination of your passionate throes it would work. I've never seen an FM-25, so I don't know if the designers made arrangements for cleaning after use, although surly they must have foreseen such an occurance. Maybe next time, you should wear a condom....

>Does any body know what I need for starting a repeater, equipment wise? I
>want it to have an autopatch, and CTCSS tones to access it.

You'll need a repeater-shack site at the base of a large tower, with a phone line or two coming to it, a good 2m antenna way up the tower, and enough Heliax to reach from the repeater shack up to the antenna. You need two 2m radios (the one you use for receive must have a PL tone decoder, e.g., the Alinco DR-110T) and a set of cavities and someone who knows how to tune them. To run the whole thing you need a repeater controller board with autopatch. You'll need a frequency-pair, which are pretty easy to get EXCEPT on the 2m band, in which case you'll have to apply to your local 2m governing body and get on a waiting list.

3540. Opinions wanted: FT-840 RCVR vs other rigs

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-18 00:00:00 UTC
From: wdzeares@ix.netcom.com
Message-ID: <4iktbv$c0b@ixnews3.ix.netcom.com>
Source record: 204392

I have an FT-840 and I am not real happy with the receiver. I have
tried a few of the new QRP rigs side by side and they have a better, or
shall I say more sensitive receiver... they were able to pull out a
weak signal better than the 840.. I am limited to QRP and I have an
indoor dipole on 20M which works great... so I need the best receiver I
can get in a rig and I still want a new rig with bell etc...
Any one hve an 840 and then move up to a different rig, or compared
receivers with other rigs?? any ideas about what receivers are better?
I don't want to spend a lot of money but between the big three, I, K,
and Y, what rigs have better receivers than the 840???
email direct to wdzeares@ix.netcom.com or wdzeares@aud.alcatel.com

3541. Please identify this Halicrafter.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-18 00:00:00 UTC
From: soniat@prism.gatech.edu
Message-ID: <4ijm1r$qks@acmez.gatech.edu>
Source record: 204393
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Gentle Reader:

What is this radio, how old is it and should I repair or replace.

It is a Halicrafter.

It has a large half moon dial labeled Tuning (with the h symbol in the middle)
It has a smaller half moon dial labeled Band Spread to the right of Tuning.
It has Two large equal sized knobs one either side of the dials.
In the lower left it has an AM/CW switch (vertical slider) and speaker/phone
switch also a vertical slider.
In the center is has a four position pointer knob for band selection.
Too the right of the band select is a on/volume switch.
On the lower right it has a standby/receive switch (vertical slider).
The dials are covered with some sort of clear plastic.
The bands are labeled from the inside out in Megacycles .55 -1.6,
1.7 -5, 5 -14 , and 13.5 - 30. Some regions are labeled amateur and
some foreign.

It has two glass tubes, two small dark opaque material tube like
components in tube like sockets, and two metal encased tube like
components. It uses 110v AC. It was reportedly
functioning but that was over 15 years ago. There is not a number or
sticker on it that I could find. It has been painted so if there was
anything etched on the cabinet it would be covered. It doesn't seem to be
rusty but the rubber bushing that separate the chasis from the housing
are mostly gone.

Rating on a scale of 0 is run over by a truck and 10 is new this could
be a 3, in other words it ain't pretty. My interests are somewhat
sentimental but my funds are limited, if I could buy a similar radio
with more modes for the same money I would seriously consider it but I
would like to get this working again.

Any thoughts.

I own a 530 and have been very pleased with it. You should also note that the 530 may still be on special. You may find it for around $270 or less if you shop around (I know AES had them for under $300 and thought I heard of a place that had them for under $270). This is noticably cheaper than the FT-51 and may be the determining factor.

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

In 1973, HAL Communications Corp. sold an MKB-1 Morse Keyboard and a KB-ID1 Keyboard Identifier. Does anyone remember these devices?

After building them from kits, they worked well. Recently I tried to change the call sign in the Identifier without success. There appears to be a race problem in the design.

Does anyone remember these devices? -The problem that makes the Identifier pattern sensitive? -A fix?

73,
Scott

Paul,

The aircraft band is right next door to broadcast fm music band. ADD your fm receiver's 'IF'- frequency (some times 20.x MHz or 10.xMHz) and with a strong enough signal from a aircraft right overhead, you may get a "mix".

Your aircraft can 'mix' with your desired station +'IF' and there you have it. Often even more magic is involved... where two signals transmitt at the same time and mix down to your fm receiver. Infact there is a very obscure program (no I don't have it) that calculates where the offending signals are and next is to build a filter to trap out at least one of the offenders.

The cure? Add a external FM Antenna... the better fm antennas look much like a TV Antenna, except the elements are almost all the same length... Use 300 ohm 'twin-line' to feed the signal to the set. Twist the twin-line as it passes from antenna, all the way to the set.

What? No screw terminals for the two wires? Then try a random 'long wire' antenna with a alligator clip on the business end and clip it to your whip antenna! You may need to move the long wire around till you find the best signal. This should provide a stronger signal from you FM station and hopefully swamp the front-end with 'desired' signal.

Weinguard makes a FM PASS filter (75 ohm coax 'f' fittings)... this signal loves the FM Brodcast band and tries it's best to reject other signals above and below the band. Cost, about $12, retail. I can't vouch for the quality of a Radio Shack equiv. More elabroate 'tunable' 'notch' filters can be had, but for lot's more money for one of quality.

Hope this helps!

Tony

Source record: 204401

I have a 7930 (2m, 25W) mobile rig for sale. Everything
is clean, the only problem is that it can be intermittent
on 25W. Is is very reliable on 5W out. Complete with
mobile mount. Asking $120, make a reasonable offer.

I also have a lowend packet modem for sale. 1200 baud. I
also have the cables to connect the two together for a packet
station. This worked fairly well. Asking $50 for the modem.

How many grandmothers do you know with 800 phone lines?

Worse than playing. Sounds like indirect harrassment of some
commercial entity. Stick them with a bunch of useless phone
calls that they have to pay for. And using newsgroups with a
large audience of collectors, bargain hunters, and wheeler-dealer
types that are guaranteed to call and leaving out any description
of the goods is pretty firm evidence.

>do you change the state of a memory channel from "programmed"
>to "not programmed?"

You have two choices. In the FT-51R manual see "Masking Memories" pg. 32 and "Memory Skip Scanning" pg. 35.

Skip Scanning: Recall the memory, press (FM), press (MR). SKIP appears in the display. That memory will be omitted while scanning, but is still active for manual use.

Masking: Recall the memory, press and hold (FM) for 1/2 second until [F] blinks in the display, then press (MR). This makes it as good as if it were never programmed.

What could be simpler? B-)

Christophe Marchal's Super Marathon

WE NEED YOUR HELP TO FIND PEOPLE TO MEET CHRISTOPHE THANKS

An educational project by Jean-Marc Dumont, English teacher at Lycee Gaston Febus High School, Orthez, France.

OBJECTIVES:

-To allow the pupils, through the use of Internet and the amateur radio station F6KGF,run by Gaston Febus' radio club, to follow the sporting exploits of Christophe Marchal, who will take part, in his wheelchair, in the Five Continents Marathon from 25 May to 16 June 1996.
-To bring together pupils and the handicapped
-To sensitize pupils to the possibility of surpassing oneself
-To make use of modern means of telecommunication
-To work with a desktop publishing package on writing in reaction to information on the Internet
-To allow our pupils to communicate with pupils in the countries Marchal passes through
-To introduce pupils to the wonderful world of Amateur Radio.

The classes

The whole school i.e. about 800 pupils aged 11-18, plus all the participating pupils in the countries Marchal passes through.

The subjects

This is a multi- and cross-disciplinary project; the majority of teachers from Gaston Febus are involved.

The schools involved

Lycee College Gaston Febus in Orthez, Tamalpais High School, Redwood High School and Drake High School in San Francisco, and several schools elsewhere in the USA, in Great Britain, Canada and Australia, all of which are linked by the Global Village project on the Internet.

Activation and Operation

As soon as Marchal arrives in a country, pupils from its schools will come to meet him and will communicate news by Internet or by amateur radio links if the Internet is not available. Pupils from Gaston Febus will then broadcast this news on news group pages (Global Village project), on their Web page on the Internet, on local radio, in the on-line press and in local newspapers, as well as to short-wave international radio stations - The Voice of the Andes in Quito, Ecuador, Radio Australia International, Radio

France International - either by Internet or by fax.

Project 'Amateur Radio Operator'

We will launch a National Appeal amongst amateur radio operators to help Marchal, himself a radio operator (F5TGY) to finance his project. The donations will be collected by the 'Association Basco-Bearnaise des Radioamateurs' in Pau, France. We shall work in partnership with the IDRE and the REF.

Activation and Operation

A national appeal will be launched to help Marchal to finance his project.
Various partners will be sought.
An Amateur Radio Operator's Diploma will be created.
The Amateur Radio enthusiast Associations of the countries visited will be brought into the project.

The F5TGY 'Association Basco-Bearnaise des Radioamateurs' Contest

To obtain the Five Continents Supermarathon Diploma an amateur radio station will have to contact at least ten stations in the country where F5TGY happens to be at the time. This means, for example that a station contacted in the United States can oonly be valid for the diploma if Christophe Marchal is in the US on the day and at the time of the radio contact. Completed logs should be sent before 30 July 1996 to F5RKJ who is the QSL manager and judge of the contest. This contest will run from 25 May 08:00 UTC until 16 June 15:00 UTC. Each station contacted will count for one point, two points if this station is in the town where the marathon is taking place ON THAT DAY. In the log reports, the date and time (in universal time) of contact and the town and call sign of the correspondant must all be noted. The same station may only be contacted more than once if on a different band each time.

TIMETABLE OF EVENTS

>selection of AM bandwidth filters, and RX audio quality. If one had to
>choose one rig to meet the needs of the SWL and Ham what would it be?
Hi Chris. Darn good question. I probably spend a lot more time SWLing
than Hamming (although I did not start out that way) and have the
same concerns.
Most of the ham/general coverage receivers have pathetic AM filters.
Often, it is just the roofing filter used
in the first (up conversion) IF. If not, then it's usually too wide
(6Khz++ at -6db) and not deep enough (more than 15+Khz at -40 db, with
no deep skirt selectivity). I am using an ICOM728 which, in addition to
the above AM selectivity specs, also sports poor audio (poorly designed
AM detector, poor audio output bandwidth which rolls off around 2kHz) etc.
Even the new Japan Radio JST-145 has a lousy AM filter.
I have looked at lots of specs and the better specs I have found are for
the Kenwood 850, which has an AM filter specified at 6/15Khz at -6/-60dB.
The more expensive Yaesu FT1000 runs 6/14Khz at -6/-60. I have listened
to an FT1000 but was not overly impressed with the audio. The new
Kenwood TS870S gives you DSP final IF at 11.3Khz with 9/12Khz AM
bandwidth -6/-60. This looks good but I think the rig costs around
$5000 Canadian!

My suggestion is that if you can afford to, get a separate SWL receiver
optimized for AM. Except for the TS870S, none of the newer ham rigs
seem to provide specs which compare with the Drake R8A (4/8 or 6/12 Khz
at -6/-60) or the Lowe HF250 4 and 7 Khz filters. While I use the
ICOM 728 under computer control for monitoring, the tough work is done
by an old Racal RA-17 with a Timewave DSP-59+. Cheers. If you find
something that fits the bill for HAM/SWL, please let me know! 73

3559. Info on RCA Commercial two-way radios

Whoa guys!

We all agree that it is an image. That's a given!

But putting a bigger antenna on it won't help! If you were standing next to a jet engine, would you cup your ears to hear it better? Or would you cover your ears?

If it *is* causing non-linearities in the front-end, overloading it even more is not going to help (why do you think they put the -20dB switch on good receivers?).

Try *collapsing* the antenna, or move it around. I know it sounds strange, but it does work. I lived directly under the path of SFO's main runway for 20 years and I have experienced almost every type of interference from airplanes. Cheap radios always received them. With high quality receivers, you usually would hear a slight drop in audio level. Like the noise, you just have to live with it. Cheap RFI filters simply don't work.

The tuners front end contains the resonant circuit which is supposed to favor the intended signal (101.7) and reject the un-intended ones (123.1). In cheap radios, this circuit is not very good, so the rejection (selectivity) goes to pieces. The quality of the IF stages also has a lot to do with it.

If the radio has a image rejection of 20dB, that means that the airplane signal has to be at least 100 times more powerful than the FM station to "break through". Easy to do when the airplane is right above your head and the FM station is 10 miles away! Capture ratio sez it only takes a dB or two to override the intended signal. And it does it!

Your best bet is to try another radio. Some *are* better than others.

On Mon, 18 Mar 1996 11:06:42 -0600,
in newsgroup rec.radio.scanner,
Isaac Kohn <ikohn@vertex.ucls.uchicago.edu>
from Ripco Communications, Inc. thoughtfully posted:

>There is a small, minor detail: Air transmissions were AM, last time I
> checked!

They still are!

>How does an FM receiver with poor-selectivity receive AM
> transmissions???

FM detectors are capable of detecting AM signals through "Slope Detection". In a nutshell: If you tune a FM detector off to one side, you can detect AM. When a FM detector is tuned "dead-on", it will have the most AM rejection. When it is tuned off resonance, to where the signal is now riding up-and-down on the steeper outer slopes of the detector curve, you create an AM detector (the detector curve is "bell" shaped) Some cheap one IC AM/FM radios use the same detector for both AM & FM, utilizing slope detection (Note that you have to disable any AFT circuits, as they will attempt to follow the signal and keep it centered).

>should do the trick, you think?

This would not be good. The 3.597 crystal is the reference oscillator for the CPU. Disableing it will disable the radio. By "bypassing", the original poster probably meant RF bypassing for VHF using amall value capacitors, along with additional RF shielding around the CPU.

I also spoke to RS tech about the problem, and they were no help to me either. A possible solution that I can see would be to change the crystal to 3.61 MHz. This would move the birdie to 148.01, outside of the bandwidth of the radio. It's close enough that it _SHOULDN'T_ affect operation of the CPU adversly. The PLL section uses a seperate 12.8 MHz crystal, so this wouldn't affect the frequency accuracy of the radio. The only ill affect could be a shift in the frequencies of the DTMF and CTCSS tones, but how much, I don't know....

3567. Recurring Repeater power amp problem???

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-19 00:00:00 UTC
From: WagnerJW@msn.com
Message-ID: <00001fed+00003146@msn.com>
Source record: 204320

Our club has an interesting problem with our 2 meter repeater's power amp. I was wondering of anyone else has had this problem, or may see something we have overlooked.

Over the past 3 years, we have had 2 different power amps fail because of what we believe to be parastitic problems.

After an amp has been on-line for a month or two, it's output begins to fail and it begins to generate very hi power spurs and other broad-band components. When the amp is disassembled, we always have found that the transistor tabs, solder, and any attached Z strips on one of the finals has been nearly destroyed by what appears to be arcing. After the initial failure, any future failures always happen on the same transistor. Our repairs have even included reconstucting the area with silver solder, but this only delays the failure an extra week or so.

What we've tried (with no success):

We have viewed the output of our exiter on a spectrum analyser, and found it to be totally clean (at least on the bench). Just in case, we have tried a second exciter, but got the same result.

We have replaced the original TE Systems power amp with a Mirage (both rated for repeater service). Same problem on the new amp.

Converted the system from a dual antenna/BP cavity arrangement to a fully duplexed single antenna system with a TX/RX Systems duplexer.

Replaced the system power supply with a surplus Lambda lab grade supply.

Our (current) Equipment:

-Maggiore ~3 watt repeater exciter.
-Mirage 4 watt in, 120 watt out power amp, typically run at 70 watts output.
-TX/RX Systems 4 cavity duplexer, 2 years old, factory tuned to our frequency.
-Approx. 200' 7/8" 50 ohm hardline
-Antenna Specialist 4 bay antenna SWR measured at the duplexer output was 1.7:1 (this antenna was replaced last week with a Cushcraft ARX-270 repeater antenna (new SWR od 1.4:1). It is too early to tell if this will solve our problem.

Any input is GREATLY appreciated!
John, N8CID WagnerJW@msn.com

3568. How do you like your Yaesu FT-3000M?

Thanks, in advance. I'm seriously considering one, and am trying to
find out the following: (manuals aren't available for one to two months)

1. Does the receiver has advanced track tuning is 110-180 MHz, like the 2500M?
2. How is intermod resistance?
3. How easy/hard is the auto dial to use?
4. Just how well does that Smart Scarch work?
5. How much and what can you control the rig from the mike?
6. Overall, how would you rate the rig?

Source record: 204324

Hi Jeff;

Before you attempt to tune up, be sure that your PA bias is set - ie: key the rig in cw with the ganged drive/gain control at zero, and be sure that the plate current drawn is at the bias mark (near S1 on the meter) The tubes idle at 20 ma apiece so they are almost cut off.

Now turn up the gain/drive until you start to draw some plate current, and immediately dip to min Ip. Now increase the drive (still in CW) and do the usual plate dip, load increase, plate dip, until the Ip is at S9+20 db on the meter. Now switch to output and tweak the plate for max. output indication.

Switch to ssb, set the gain up to about 3:00 and give a test call. You should see some ALC voltage on the meter in the ALC position. The ALC works really well, so don't be concerned about running the mike gain too high. The HW-101 has an excellent modulator with really wide dynamic range and they have really super audio on the air.

By the way, you might want to check the 2-33k ohm plate resistors on the plates of the 12AU7 carrier oscillator, and the 470k ohm resistor biasing the 15 volt zener diode on the cathode of the 6EA8 VOX relay tube. I have fixed a number of these units for folks over the years, and those parts have almost always drifted way up in value. Eventually the carrier oscillator output drops off and one sideband or the other gets weak. In the case of the VOX, it becomes erratic. If you have a power meter, the HW-101's typically deliver about 112 watts rf output into 50 ohms at 75 meter frequencies.

My partner and I are using the Ramsey FR-146 2-Meter FM receiver kit to receive data broadcast at a frequency of 155.445 MHz. The data is sent with a 6 second delay between each new message. We are having trouble squelching out the noise during the 6 second delay period. The squelch seems to either cut out nothing or it cuts out everything including the data being broadcast. If anyone has any information regarding this kit or where we could receive help, we would appreciate hearing about it. Please e-mail any comments or suggestions.

Thanks.

Hi,

I'm thinking about buying a ham handy talkie and using
it on my motorcycle. I know that Wingers and Harley touring types
use CBs on there bikes and I'm wondering if a special
type of microphone is necessary due to wind noise. I could
go with either a headset mic/headphone combo or a earphone
and a handheld mic, so info on use of either type would be
appreciated.

My bike is not a touring machine and only has a windshield,
so there is probabaly going to be more wind noise on it.

Please reply via email to daveg@heurikon.com

Thanks,
Dave

IN BEHALF OF VALERY RA1AOM AND ESKO LESKINEN OH6CI

I,Olli (OH6CT) and Esko (OH6CI) are very good friends of Valery RA1AOM and we were pleased to see the information about Val`s keys sent by Dave K8MN.

Unfortunately there was a little misunderstanding and i would like to inform all those who are interested in Val`s keys that first of all that making these keys of very high quality is more or less a hobby for Val and I am not a rep for these keys, just a friend of Val`s

Esko is working in Russia in other business and He knows Valery by this Hamradio hobby. Esko realized very quickly that Valery makes one of the best keys in the world. Esko invited him to Finland couple of months ago to visit SRAL ham event in Kouvola.Esko was sure that there would be Finnish hams who would be interested in these keys and Valery would be able to sell few of those keys. Indeed there was lots of interest for those keys and currently Valery has got atleast 40 keys ordered from him to Finland,Germany,U.K,and USA.

In principle there are two different models of paddle keys, chromium plated and marble based in different colours. Also straight key is available. Val told that one paddle key includes about 50 components.All of those components are handmade without any machines. To prepare one paddle key about 4 to 7 days is needed which means that it is not possible to make a big quantity in a year.

As told earlier making these keys is has been mainly hobby than full time work for Val Esko has recommended Val to put up a small company by him self to make these keys. If he is receiving enough of orders he might take this key making business as a main job for him and by that way maybe secure a better life for his family.

If you are interested in buying one of his keys you can send a letter to Esko and Esko will take those letters to Val. Esko comes over every third week from St Petersburg to Helsinki. Val is going to answer every single one personally and send a photograph and other information about his keys

Send your requests to

Esko Leskinen OH6CI c/o RA1AOM
P.O.BOX 13
01661 VANTAA
FINLAND

p.s I have given already all e-mail requests sent to Dave K8MN to Esko and Valery has got those reqests by today

Kind Regards

Olli Tuppurainen OH6CT / OH2KVH

>whether it's a xcvr, rcvr or xmitter..... what band(s) does it cover....
>what mode(s).... etc. etc. (power output too maybe?)

For Isaac and others interested - The Ten Tec Triton IV is a
1979 vintage fully solid state (one of the very first) HF SSB/CW
transceiver. It covers 80-10 meters not including WARC. Has
full break in CW, and it works well. There was an analog version
and a digital readout (actually a frequency counter, not a readout
on todays rigs) version. It is not small, but is pretty darned
light. Needs 12 volts at about 20 amps to run. Very low current
drain on receive. No microprocessors inside, except in the
frequency counter version.

I had a few of these and they are darned good basic radios. Worth
every penny of $175 and more when in good shape with accessories.
I inquired about this radio but I believe it had sold in moments...

I just bought an IF-10B from R&L Electronics for my Kenwood. Seems that Kenwood
ran a few more through the factory recently. You might try calling your local
ham supply house.

Bill,

There is a boatanchors mailing list, which includes not only postings of boatanchors, but a lot of boatanchor expertise as well. If you are into boatanchors at all, you should check it out. You can subscribe by sending e-mail to listserv@theporch.com. Leave the subject line blank and enter the following in the body:

subscribe boatanchors <your_email_address>

There is a $12.00 annual charge, and IMHO it is a bargain. There is a free three-week trial period to check it.

73,
Jeff, KC1MK

Yes,

There is the Boat Anchors e-mail list. It is subscription only at a cost of $12 per year. Newcomers can get a free trial subscription for three weeks.

To subscribe send an e-mail message to listproc@theporch.com. Leave the subject blank and type the following in the first message line:

subscribe boatanchors your_name

: >There is a small, minor detail: Air transmissions were AM, last time I
: >checked! How does an FM receiver with poor-selectivity receive AM
: >transmissions???

: If close enough, it will. I have picked up CB radio transmissions (Also
: AM) on a nearby FM reciever.

"AM rejection" is a spec which applies to FM radios. It is worse on
cheaper ones.

The circuitry used to detect FM signals can respond to changes in the
amplitude. Especially when the circuit is cheap, and under conditions
where it is overloaded.

On my W21AT, I did the button presses mentioned below and it does not
even accept the frequency I enter (I'm entering a 460 MHz frequency).
It behaves like it did out of the box - you press a "5" in UHF mode and
the display instantly displays "445 " MHz. Any useful hints as to what
I'm doing wrong? I'll be grateful...

> 73 de KB9JTT
> willf@rrgroup.com

Alinco had a problem with high deviation, they will fix (adjust it) for
free.

I agree that the DX70 is a better hf radio than the 706 is. Its only
drawbacks are low power on 6m, and it doesn't have 2m. (does the 706
really have 2m that works??)

My advice, buy the DX70, then if you really want 2m, get a seperate
radio, then you can listen to both at once too.

You may want to contact Communications Specialists. They make CTCSS encoder/
decoder boards and have several application notes on how to use their products
with older radios. (Sorry, I don't have their phone number handy, but I
believe
they advertise in QST...)

Hope this helps!

Erasing only that memory, clearing its contents would be simpler. It seems illogical that you can't do this. If you make a mistake, it stays there and all you can do is mask it...I'm with R.D.

You can of course clear all the data in memory. Just follow the instructions in the manual for enabling wide receive mode, then those for returning to ham band only reception. I can tell you from experience this will do it. ;-)

But I still like this little HT anyway.

3605. Advice Wanted on How To Start

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-19 00:00:00 UTC
From: Jeff Childers <childers-md-nmd@anmd-usassdc.army.mil>
Message-ID: <4in151$22f@michp1.redstone.army.mil>
Source record: 204358

I received my nivice ticket several years ago but got busy and never did anything with it. Now I am thinking of getting my technicians license and setting up a rig.

The question is how do I go about selecting my first radio and obtaining local assistance in setting it up? The magazines have equipment in my price range but I don't know what features to include/exclude from my first purchase.

If you can offer advise or guidance or just tell me what you did at first and why it would be appreciated. Thanks.

J.K. Childers

3606. FS: Heathkit SB-102, SB-640, SB-600, HP-23

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-19 00:00:00 UTC
From: QRP%mimi@magic.itg.ti.com
Message-ID: <4in9tc$i80@mksrv1.dseg.ti.com>
Source record: 204359
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

FOR SALE: Heathkit HF station

SB-102 HF CW/SSB transceiver:
all tube type (no solid state here!)
100 Watts PEP output power on 80/40/20/15/10m
original Heath 400 Hz CW filter installed
fresh alignment by a local tube-rig restorer
all weak or bad tubes have been replaced by me
no modifications (except as required to connect
SB-640 Remote LMO, and previous owner's mod to
connect one of the Heath spectrum analyzers)
copy of manual
SB-640 Remote LMO:
fresh alignment by me
tubes tested good by me
new interconnecting cable built by me
copy of manual
SB-600 Speaker:
no modifications
sounds good and clear
HP-23 Power Supply:
no modifications
all voltages checked correct by me
cable to connect to SB-102
not mounted inside SB-600, but it can be
copy of manual

Cosmetic condition is GOOD, but nowhere near mint. No
serious damage to anything. Cabinets on SB-102 and 640
have been painted a light green, a lot brighter than
the original, but attractive. A real purist would want
to strip and totally refinish the cabinets, but anyone
looking for a rig to actually USE would leave them alone.
The SB-600 and HP-23 have not been repainted and look
good. The SB-102 and SB-640 front panels, knobs, VFO
dials, etc, look good. All lettering on the panels is
in good shape with no appreciable wear. Inside, all of
the units are in good shape, not all full of crud and
lint like many old tube-type rigs get.

Operating condition is also good. Freshly aligned and
working correctly. The CW filter is an original Heath
optional unit, installed by me.

The asking price for this setup is $300. I do not want
to sell any of the pieces separately (sorry, I know how
hard the speaker and Remote LMO are to find any more).
A microphone is NOT included (I don't have a spare).
The buyer pays the ACTUAL shipping costs.

E-mail or phone me if you're interested. 73 and Thanks!

I don't think there is any point in trying to make a silk purse out of a
sow's ear. He should go get a decent radio receiver rather than try to
patch up a poor one.

Also, it may help more to decrease the signal strength rather than
increase it.

Anthony O. Cardenas ~ WA6IGJ (cardenas@kaiwan.com) penned:
: petern@terraport.net (Peter Neidhardt) wrote:

: >I own a cheap General Electric boombox... I am on a certain FM channel
: > I intermittenly pickup actual radio transmissions from overhead commercial
: >airliners...
: ^^^^^^^^^^^^^^^^^^^^^^snip -to-fit^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

: Paul,

: The aircraft band is right next door to broadcast fm music band. ADD your
: fm receiver's 'IF'- frequency (some times 20.x MHz or 10.xMHz) and with a
: strong enough signal from a aircraft right overhead, you may get a "mix".

: Your aircraft can 'mix' with your desired station +'IF' and there you
: have it. Often even more magic is involved... where two signals transmitt
: at the same time and mix down to your fm receiver. Infact there is a very
: obscure program (no I don't have it) that calculates where the offending
: signals are and next is to build a filter to trap out at least one of the
: offenders.

: The cure? Add a external FM Antenna... the better fm antennas look much
: like a TV Antenna, except the elements are almost all the same length...
: Use 300 ohm 'twin-line' to feed the signal to the set. Twist the
: twin-line as it passes from antenna, all the way to the set.

: What? No screw terminals for the two wires? Then try a random 'long
: wire' antenna with a alligator clip on the business end and clip it to
: your whip antenna! You may need to move the long wire around till you find
: the best signal. This should provide a stronger signal from you FM station
: and hopefully swamp the front-end with 'desired' signal.

: Weinguard makes a FM PASS filter (75 ohm coax 'f' fittings)... this signal
: loves the FM Brodcast band and tries it's best to reject other signals
: above and below the band. Cost, about $12, retail. I can't vouch for the
: quality of a Radio Shack equiv. More elabroate 'tunable' 'notch' filters
: can be had, but for lot's more money for one of quality.

: Hope this helps!

: Tony

>
> TNX, de AB7FV, DaveDave,

I have the TM-451 and TM-251 both great radios, however if you plan
to use them on a good high gain antena you better think twice buying a filter
along with it. When I connect my 251 to the my j pole on the roof I have to
use a notch filter to filter out of the pagers in my area. I think that this
radio has this problem because of the 9600 baud ready out of the box. IF
filter is really wide (I think) However when I put this same radio on a 5/8
wip on the car and go around town and by the house The intermod goes way
down.(90% gone) So I do not know if it is just the location on my roof or it
is gain! I suspect I get more gain out of the jpole on the roof over the
5/8 wip on the car.

Other than this observation, I love the radio and inspite of the intermod, I
would buy the radio again!

DTMF dialing works fine from what I have seen. (It works the auto patch and
that is all I care!)

Hope I have helped and
understood your request!
Take care

A completely different approach might have got you oodles of help!
When the situation demands it, I can also blister the air blue. It helps alleviate the pain and frustration and/or is excused because it was delivered with such wit and good nature as to be forgiveable.

What you do appears to be to seek attention (pathetic!), or to troll for flames (this time you got some!). My kids read my screen too, and I resent having to explain to them that the foul-mouthed norms you have adopted are characteristic on any channel that has a wide audience, and are unrepresentative of the rest of us. (eg. - repeater usage).

Jeez - I don't even know what "undernet" is... maybe it's time to do a little slumming!

73's ??? naah, the concept is wasted on you.
88's as appropriate ??? OK - I gotta place (I'll show you where!)

Carl,

Comet make a diplexor like you desire. Ithe model is CF-360. I am
using one with my 706 and it wirks fine.

I would have a look in the latest Artsci manual. You better be ready to do some desoldering. there is a box with 20 pins that needs to be desoldered, two SMD devices removed and under the main board a circuit trace to be cut and jumper added. then when your are through the radio still will only offset 4 megahertz so it is impossiable to span the two meter band. if you have a CAP repeater with an input on 143 Mhz and output on 148 Mhz you are out of luck, the 706 will not do that split, only will do 4 Mhz tops.

Yep...Comet and Diamond (I think) make such a diplexer...

all it is is two filters....one HP and one LP both cutting off near the appropriate ham band (the HP cuts off at 45 Mhz...the low pass cuts off at 32 Mhz)...the crossover isolation allows lowband and 6mtrs-up to operate ok..

(the design is the same whether UHF/VHF or HF/VHF or X/Y....all you got to do is make the circuit have enough isolation between ports by making the cutoff freqs as far as possible from each other and yet still allow the intended range to pass thru with little loss)

I have one of the COMET HF/6 diplexers...works great!

use it on my TS680

Could someone direct me to a good book on repeater linking. I have
heard of voters and linking remote receivers via radio or Telephone lines.

I looked in the Handbook,but it really doesn't explain to much. What I
want
to know is a Remote receiver just that ,a RX radio or is it a another
Repeater!
I have a repeater at my home, and I would like to try and extend
coverage
for my handheld and mobiles. If I have a another person that will let me
install a antenna on there property, then I need to know how to link it
to my
base. Appreciate your help.

3616. VHF Motorola Mitrek modifications

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-20 00:00:00 UTC
From: draagen@news.connectnet.com
Message-ID: <4iph2b$f8v@news.connectnet.com>
Source record: 204262

I recently acquired a 60W VHF Motorola Mitrek radio, a single-channel version apparently capable of covering from 136-146 MHz. The channel elements installed are for 149.1 (both transmit and receive).

It would appear (from indications in the service manual) that all that's required to make this radio a four-channel model would be more channel elements, and simple modifications to the cable. (I'm going to be home-brewing a control head, so I can make that whatever I need it to be.) Am I right about the cable?

What I can't tell from looking at the service manual is what (if any) other modifications are required to operate on the 2 meter ham band (I'm aware that I'll need to get channel elements for the frequencies desired).

My intention is to modify this radio for eventual use at 9600 packet, and I have what looks like a good modification procedure obtained on the WWW at 'http://www.gag.com/papers/mitrek.html.' There're only two places where it leaves me a bit uncertain.

One is where it says to remove R515. On the VHF model, there is no R515. I would probably just 'drive on,' except that the other place I'm confused is where it says to short jumper from R501 through hole to R515 through hole.

My confusion here is two-fold. First, _which_ through-hole (it looks like the resistor is mounted in two, one at each end), and second, since the VHF radio doesn't _have_ an R515, I'm not sure where to run the other end of the jumper, even if I should manage to guess right as to which through-hole to jumper _from_.

Also, is there a tuning procedure that can be done without much in the way of test equipment? Assuming I obtain appropriate channel elements and can operate the radio as a four-channel unit, how can I insure that it performs acceptably?

Finally, in the April, 1996 issue of _CQ_VHF_, the 'Digital Data Link' column, N2IRZ writes that '...even relay-switched radios can be modified (with a smaller capacitor in the PTT line) to provide reasonable TXDleay (TXD) times...' Does that comment apply to the Mitrek, and if so, what capacitor should be changed, and what value should it be replaced with?

Thanks in advance for any assistance anyone can render on any part of this puzzle.

Thanks, in advance. I'm seriously considering one, and am trying to
find out the following: (manuals aren't available for one to two months)

1. Does the receiver has advanced track tuning is 110-180 MHz, like the 2500M?
2. How is intermod resistance?
3. How easy/hard is the auto dial to use?
4. Just how well does that Smart Scarch work?
5. How much and what can you control the rig from the mike?
6. Overall, how would you rate the rig?

>appreciate any info. Tnx.

Some people don't realize it, but even though the Atlas is relatively
small, you can turn it into a "handheld" sized unit. Indeed, it
can and *should* be done with any Atlas radio.
The way you do it is to find the nearest industrial strength
trash compactor, insert the Atlas radio, switch the compactor on and
crush the Atlas into a small, neat, easily handled package.
Don't worry... it will work just as well crushed as it ever did before
and it's much easier to carry.
You said he gave it to you... you STILL didn't get a good deal :-).
But, I'm not sure I'd call anyone who gave me an Atlas a "friend".

That's the best help I can give you. I guess this post really
tests that "I'd appreciate any info" line, doesn't it? :-)

3625. HTX-202 Question

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-20 00:00:00 UTC
From: Steven Meltz <driller@mars.superlink.net>
Message-ID: <4ipobi$dsu@earth.superlink.net>
Source record: 204271

I have two 2 year old HTX-202s, one of which has developed the following problem. I use the rig mobile, and on a few (seemingly random) frequencies (one of which is my favorite repeater naturally!) the unit takes a few seconds to come up to full power when I press PTT. I measured the output with an external meter, and I get the same indication; the power goes up to 2 to 3 watts, than after 1 to 3 seconds will "jump" up to full 7 watts. The SWR is 1:1. Again, this only happens on a few frequencies. I brought the unit into the house and it acts the same.

Any theories or solutions would be greatly apprectiated.

Thanks.

> * CMPQwk #1.42* UNREGISTERED EVALUATION COPY

Ed,

They sell for about $80.00. I think the mic case is a bit too large as it doesn't seem as comfortable as the original one is. The backlighting on the buttons might be a bit brighter. It looks like an LED is use for illumination. The PTT button requires too much pressure to comfortably hold down, but that is easily fixed.

Just open the case and you will find a conical shaped spring with a small rubber insert inside. Just remove this spring/rubber assembly, and close the case. The PTT will actuate with a very light touch. It will spring back because there is an additional high density "foam" rubber bar attached to the PTT bar which provides the return action. My mic also seems to be "hot" audio wise, more so than the original, but that's no big deal. There is also a metal weight mounted on the back inside case to give it some heft. They removed the round dashboard mounting button and replaced it with a rediculous metal "loop" hanger. The elongated hole in it is so small that no knob on my cars will allow it to hang.

All in all, it's a bit pricey, but it does the job. Kenwood ought to look at some of the Yaesu mics for ideas.

The replacement for the FT-530 I thought is the FT-51R. Yaesu is selling both at once, for some reason. I love my FT-530, but some of the programming of unusual things is impossible to remember for me and I have to look it up in the manual. Other things are obvious and convenient to program. I also have two different ICOM handhelds. They are all good products in my opinion, but the $289 price for the FT-530 is really spectacular for such a fine radio!!!

Take a look at the Yaesu FT-900, Its sounds great on AM,
compared to my other rigs. Rig now, every one chasing after the IC-706,
but for a good DX and SWL Rig the FT-900 can't be beat for the money,
and performance. I seen a few almost new, super clean ones go for $900
to $1000 with the tuner built in.
A lot of the bigger HF rigs right now don't seem to moving that fast
since 80% of HF rig sales in stores have been the IC-706. You can
take advantage and get a real nice rig, at a great price, for the FT-900.
I have a IC-706 and a FT-900 and won't let go of my FT-900. But a few
hams have been trading in the FT-900 for the smaller IC-706.
The passband tuning, filterig, AM detector, Noise Blanker, Imd rejection
are much superior in the FT-900. Sounds like one of my old Hallicrafter
SX-122's receivers on AM.

That's a great deal folks, if the units are working. I paid more than
that for the HP478A - and didn't even get the connecting cable. If I
didn't already have one, I'd snap it up....73 de KI7RH

Hi Barbara:

The MC-90 microphone impresses me as being grossly overpriced and having no particular audio attributes that would justify its price. It was introduced about four years ago as a recommended companion to the TS-950SDX.

I have no personal experience with this microphone, but I've spoken with a number of operators who were attempting to use it with rigs like the TS-950SDX and TS-850S. They have all commented on its low output. The greatest problem was that most of these rigs did not possess sufficient VOX gain to permit dependable VOX operation with the MC-90. If VOX is not important to you and if you speak above conversational level, this microphone should be able to drive the TS-870S to adequate ALC --- but in all probability, the MIC control will have to be advanced further than for many other microphones.

Regards,
Keith (KS9C)

From: n3usqn3usq@aol.com
Message-ID: <4iqfsl$8hi@newsbf02.news.aol.com>
Source record: 204283

Greetings!

Is anyone out there using a computer to control the Icom IC-706? I know the radio has a computer port, and I know there are interface adapters out there, but is anyone using them? Has anyone heard of computer programs for this? Is anyone out there? Does anyone care?

Thanks. Send any responses to Jeff, jbaker@ubmail.ubalt.edu as well as posting on this news group. 73 de WK3U

I have for sale a Drake UV3 tri-band transceiver. This unit operates
on 2m-220-440, 10 watts low and 25 hi. The unit is in exceptional
condition and comes with the following accessories:
Matching Drake external speaker
Slide-in mobile mounting bracket
Standard mobile mounting bracket
Comet tri-plexer (new in bag, never used).

Asking $400.00 for all. -Eric - N6ITD

> John, N8CID WagnerJW@msn.com

John:
The bypass relays are a real problem source with these amps. They usually switch with each transmission and sometimes stick, this leaves no load on the amp with full power. You can lock on the relay, but the amp will draw about 2 amps on standby due to the biasing of the transistors for SSB operation. A simple mode can be made to remove the bias. I have used both of these amps and have had both fail. Both manufacturers suffer from poor quality board soldering. These amps are not good for more than 20% duty cycle. Ham repeators need CCS(continous commercial service) rated equipment, as they are on for hours at a time. Be sure to use an isolater on the output of the Amp, this will protect the amp from intermittant antennas, also will help intermod problems.
I have used commercial quality amps with good reliabilty, but they are not inexpensive.

>Does any body know what I need for starting a repeater, equipment wise? I
>want it to have an autopatch, and CTCSS tones to access it.

The *very* first thing you need is a coordinated channel pair. This is
the essential first step. Depending on where you are, there may not *be*
any 2m pairs available. In that case you'll need to look to another band,
such as 70cm, 23cm, etc. That has a major impact on equipment selection.

For any repeater, you need a bulletproof receiver, a clean transmitter,
and some form of controller. If you desire a single site with a common
antenna, you'll also need a duplexer ($$$). If you go to a split site,
you'll need a link. That can be a dedicated phone line, or a radio link,
and you'll need a coordinated link frequency in that case, in addition to
the extra receiver and transmitter for the link.

Since you want to use CTCSS, the controller can be as simple as a
CTCSS decoder driving a PTT relay, with a timeout timer and IDer
spliced in there somewhere. (You'll also need a separate control
receiver, or a dedicated phone line, to maintain positive control of
the repeater as required by the regulations.) You could have a whizz bang,
singing and dancing, beeping and booping, pinball machine noise making
computer controller with 999 voice mailboxes and automatic paging, but
please don't do that. It's like teaching a pig to sing, it's not pretty
to listen to, and it annoys the pig.

Oh, and if you must compete with the cellular industry, you'll need
a DTMF controlled phone interface and another dedicated phone line.
Don't forget power supplies for everything, and a nice high site
with hardline and commercial grade antennas on which to put everything.

While you *can* put together a good repeater for under $500 (mine
cost about that), if you aren't very knowledgeable, and a hell of
a scrounger, figure on about $3000 for a serviceable repeater package.
And unless you find a free site (rare), figure on up to $500 a month
for site rental. (I'm lucky, I have a free site, and it even includes
free power with a 500 kW emergency backup generator. Most repeater
owners aren't so fortunate.)

>use a notch filter to filter out of the pagers in my area. I think that this
>radio has this problem because of the 9600 baud ready out of the box. IF
>filter is really wide (I think)

Nope. The pagers are up around 158 MHz, the 20 kHz wide IF filter
is just as good at blocking a signal 21.4 MHz away as a 15 kHz
IF filter, IE not at all because the filter is in the *IF* not in
front of the first mixer. The *real* problem is the *very* wide
filter in front of the first mixer that allows out of amateur band
reception. It also lets the *image* frequencies through. Not good.
This doesn't have anything to do with the radio being 9600 baud
"ready" (it really isn't, and BER is still excessive).

>mwilson@bangate.compaq.com

Although one is tempted to go with an 'off-the-shelf-easy solution'
for a repeater receiver, all this guarantees is another alligator
repeater (large jaw shuts on weak received signals as soon as the
transmitter keys up) wasting another repeater pair.

Modern rigs of almost all nature, and any commercially produced
amateur rig (ever made) are poor choices for all but the lowest
powered repeaters (10 watts or less). Even with high quality
duplexers you need some front end selectivity that only commercial
radios have (e.g. Motorola, Ericcson/General Electric, EF Johnson,
etc.).

Even some of these commerical radios have eliminated narrow/selective
receivers to make service, sales, tune-up so that anyone with a
computer can sell radios (doesn't need *ANY* service equipment, or any
knowledge of radio repair other than 'push button and talk into box').

Motorola Micors, Motorola Mitreks, GE Mastr II, GE Custom MVP, all
have helical resonators in the receivers and are good for repeater use
(even as mobiles, they work as bases). And best of all they are
obtainable for $25 to $100 each at hamfests (working, but often banged
around and dirty ;-(

Whatever you do- please don't put another repeater on the air that is
heard 100 miles away, that 50 watt mobiles cannot work reliably into
until they are within 30 miles of the repeater- this is a huge waste

of spectrum and only makes you a bad RF neighbor to repeaters on the same frequency pair.

> >This sounds like one of the many S-38 variants to me.

The real issue here, however, is the conditipon of the "rubber
bushings"...these are insolatore that keep the cabinet isolated from the
chassis which is HOT! This is an AC-DC set, having one side of the AC
line connected DIRECTLY to the chassis. If your plug or receptacle is
wired incorrectly, and you happen to touch the cabinet and a good ground
at the same time, you'll probably understand what toast feels like!
Forgive the shouting, but DO NOT OPERATE THIS SET WITHOUT AN ISOLATION
TRANSFORMER. At the least, replace the isolation bushings with rubber or
plastic to maintain the insolation. Really.

Source record: 204422

My dad has aquired a secondhand Kenwood TR-2500 handheld 2m FM Transeiver.
It came with a buch of stuff, car adapter, AC adapter, hand mike etc..

The problem is there is no manual. Both him and I have played with the
radio for a fair while, with very little success on making it do anything
more than the basics.

My dad claims to have attempted to contact Kenwood. If anyone has a
source for manuals, or is even willing to provide some very basic
operating instructions, let me know.

Also: a source for batteries would be nice. All of the rechargeables
that came with it would not hold a charge. A hack was made, using a battery
case, and a bunch of AA's, but the proper rechargables would be nice.

Please EMail, as I don't read this group often. If intrest is expressed
in what I found, I will summarize.

Thank you.

Howdy!

I'm looking for a mod to enable cross-band repeat
in my Delta 100.

Also, I've been trying to get a service manual for
the damn thing, but Icom (Australia) claim one was
never produced for the Delta 100.

All I really need is a copy of the schematic so I can
improve the transmit audio which is really restricted
and disgusting !!!

Any help much appreciated.

Please email me.

Cheers,
Adam VK3ALM

>damage them.
>Anybody have any facts/stories along these lines?

Well, I have a sad story to relate, and I'm embarrassed about it
because I'm an Extra Class ham, have been licensed since 1968 and
am an engineer (albeit mechanical, so I'm not quite as embarrassed
as if I were an EE!).

In my shack/office/computer room I had a 1984 vintage 13" Zenith
TV using rabbit ears (I'm at war with my incompetent cable company...
sorry, "incompetent" and "cable company" is redundant, but that's
another story). I have a couple of outside antennas for 2 meters, but
during thunderstorms I don't want them connected (for obvious reasons).
Yet, I try to participate in Skywarn... so I built a 2-meter J-pole, and
put it in the corner of the room. Ah, in this case, the "corner of the
room" was about 5 feet away from the TV rabbit ears.
The J-pole did a good job on most of the local repeaters, so
ultimately laziness took its toll and I left my 25 watt Icom IC-25A
connected to it almost all the time.

I noticed that when I transmitted the TV picture would "scramble",
but in a world-class case of brain-lock it didn't occur to me that it
was roasting the TV tuner. Ultimately, the reception on the VHF got
progressively worse, even though I'm literally line-of-sight from the
two primary VHF stations in this area. Investigation (confirmed by
a electronics tech friend) showed that the VHF tuner was shot.

THEN it suddenly occurred to me that the proximity of the two
antennas might have been a bad idea! So, wiser but poorer now,
I learned that 5 feet of horizontal separation is NOT enough for
a 25 watt transmitting antenna and a receiving antenna.

So, even though your application is HF, you are also considering
2x-4x the power... be careful.

From: "Alan Johnson"
Message-ID: <4inje6$btl@Twain.MO.NET>
Source record: 204432

I want to us a Mitrek as a remote base on 10 meters. I have it running now as a stand alone rig and it works fine. To run it as a remote base I want use it without the control head. Does anyone have the pin out of the connector on the from of the radio. And does anyone know what has to be connected to what to activae the radio without the control head. There is an article in the March CQ that talks about using a Mitrek for Packet but the article doesn't explain all of the connections.

Thanks for any and all help.

Barbara:

I've corresponded via email with wiley@interaccess.com (bill) who used an MC-90 briefly before selling it. I understand that the output was lower than the MC-60A output, but you might email him and ask for a more thorough explanation.

I spoke with Ken Reilly of Kenwood's service department in California, and he speaks well of the MC-90 with his 870 that he uses for DX-ing.

Good luck with the answer to these questions; I've been hoping for some more information myself!

> 3/30.
>
> Stephen
> KF6BTE

I have had one for almost a year now, and have no complaints with it. I have used it in the car, at home, on packet, just about everything. I have transmitted through it for up to 20 minutes continuously (running Newsline on a net), with no problems at all. The preamp makes an obvious difference, and the helical filter works well too (can't receive the local NOAA station at 162.something when it's connected).

One bad aspect I have noticed is that its over-SWR protection circuit is a little too picky for my tastes. It really likes to have as perfect an SWR as possible.

Overall, the amp has worked well for me, and I get an honest 30+ watts out of it.

3671. Info wanted on EICO 324 Signal Generator.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-20 00:00:00 UTC
From: cweddle@astro.as.arizona.edu
Message-ID: <4inmet$14ke@news.ccit.arizona.edu>
Source record: 204438

Looking for info/schematics/manuals on an Eico 324 Signal Generator, s/n 74804. This is a 2-tube model with coverage (it claims) from 150KC to 435MC in 7 bands labled A thru E, F1 and F2. But the BAND SEL switch has only 6 positions labled A thru F. Other controls are: AF MOD/OUTPUT 0 to 100; SIGNAL SEL with POWER OFF, RF EXT MOD and INT MOD AF OUT; RF COARSE with LO, MED and HI; RF FINE labled 0 to 100. Connectors for AUDIO IN/OUT (bannana jacks) and RF OUT (old type of mic jack). Tubes are 12AU7A (clearly readable) and what looks like 12AV7 (difficult to make out).

This little box was found in a big pile of real ugly junk. But it's in very good looking shape, hardly scratched and very clean in and out. Might be fun to get it working and keep on the bench. Any information on this gadget welcomed.

From calling the number myself (since I heard it was O.O.S.) and listening
to the OOS announcement, it sounds like a paging terminal. Probably a
personal 800 number from Skytel or other carrier. Perhaps the poster
discovered it was not a wise move to publish his pager number here after
he got flooded with calls (like the one I just made) and changed it.

I realize $12 isn't very much money, but this is the first I have heard
of a hobby/non-commercial mailing list requiring a paid subscription. Is
this new or have I just missed this evolution?

Sounds like a Hallicrafters S-38. If you want to restore it as a classic radio, fine. In pristine condition, a radio like that might be worth $80 - $100. But if you want to actaully use it, get a new radio. Any modern radio, even a very inexpensive one, will outperform it even you restore it to like-new working condition. You'll spend more in parts and frustration trying to get a wrecked old H'crafter working than you'll spend on a new radio. Best of luck.

Not sure what you ride Dave but I have used a 2M rig on my ZX-11 a few times with good success running the same mic that worked on fully faired bikes I've owned. I simply mounted a mic cartridge in the chin piece of my full face helmet and used a PTT switch mounted to the left handlebar. If wind noise is a problem try placing a small piece of cloth over the top of the mic element. If I were going to use the HT on the ZX-11 more often I would add a switch to change the horn button between Horn and PTT duties. Good Luck!

Opinions expressed herein are my own and may not represent those of 3M.

3694. ic2400h vs. ft2500 ???

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-21 00:00:00 UTC
From: larry@lmb-tech.com
Message-ID: <3150a508.93236835@news.netgate.net>
Source record: 204212

I'm in the market for a new 2m mobile rig. The ic2400h and ft2500 are the two units on my shopping list right now. Looking to decide which is best. My operational needs are simple, either unit meets them fine.

One major requirement is durability. The Yaesu with their mil-spec. appears to win here, but the Icom looks pretty durable as well.

Intermod rejection is important, since the radio will be used in the house with a large antenna at times.

Any comments on either of these radios would be appreciated.

Thanks, Larry

> Imagine if they go democratic/free enterprise.
>Japan times 1.2 or so BILLION people. But they WILL be a big
>market :-).

The sooner they do, the better for us. The problem is, you can't have free trade between a free society and one ruled by totalitarianism. In the latter, people are forced to exist at a much lower standard of living than they would rise to of their own accord. That means they work under conditions that are unthinkable in the free society.

Once these two types of societies start trading, the free society either loses all jobs to the Communist state, or must voluntarily reduces its own standard of living in order to retain the jobs. In either event, the end result is the same.

We cannot afford to trade with any country that does not observe the same individual rights that we require within our own system. To do otherwise is economic suicide.

I have a 211 and to solve the problem I added a Communication
Specialist TE-32 encoder. The front plate of the encoder has a rotary
dial with all tones listed, so no dip switches to set each time. It
works perfectly, five minutes to hook up, and I think about $50.

Or you can set up your repeater linking two frequencies outside of the accepted repeater subbands (established to prevent conflicts between repeaters and simplex operators) on what is used by local groups for emergency communications, intentially interfere with them, then tell any simplex operators who come across it that the repeater's legal to the letter of the
law (legal, but not polite) and wonder why everyone suddenly no longer respects you--as a ham or professionally.

Grrrrrrr.....

>Rich..k2koq

One great use is using a transverter to get another band.....

ie: 20 meters to 6 meters. 14.0-14.35 is not much good, but 14-18 is.

Just my two cents...

Someone's been reading too much Rich Measures stuff, hi. :-)

Oscillations usually come AFTER the board starts falling apart, not before. Lots of these little amps aren't cut out for repeater duty, the components are just too small. Output strip lines and the other components carrying high RF current deteriorate. These components all affect stability. The next thing you know the amp is smoking and arcing, totally detuned, and maybe even oscillating.

One case where the amp oscillates before the strip line and related components fail is when the load is VERY hi Q, like the cavity on the repeater. On occasion you can add enough loss between the amp and the cavity to de-Q the load. At other times you may need to add a circulator to stabilize the amp.

Solid state amps, as a general rule, do not "like" high Q loads like cavities! They don't like heat from repeater operation. Could be either problem.

BTW, you're running WAY too much power on that Mirage for repeater duty. Ham amps are just too cheap and designed wrong for CCS duty.

73 Tom

>Rich..k2koq

I can't speak for Robert Young, but there are several reasons
why people want to modify radios for general coverage transmitting:

1. Emergency preparedness. Amateurs are allowed to use any means
necessary (i.e., frequency, power, mode, etc.) to gain help when
life of property is in danger.

2. The amateur may wish to participate in MARS and/or CAP on HF.

3. An amateur may want to use an HF radio as part of a VHF/UHF/microwave
transverter lash-up, and wideband transmit may be extremely useful for this;
the bands at VHF, UHF and microwave are larger than any HF band.

4. A person may want to operate on 11m. This isn't legal, of course.

RE: Adding PL tones to an older rig:

I suggest you purchase a CTCSS encode board manufactured by Communications Specialists. I am using a Comm-Spec SS-32P board in my ancient Kenwood TR-7600, and I have used this same board in other rigs in the past. The board is really tiny (0.9" x 1.4" x 0.4") and runs on anything from 6 vdc to 25 vdc. It has a four-place DIP switch used to select from one of 32 standard EIA tones. You can mount it inside your rig with a double-faced sticky foam pad. The only drawbacks are (a) you can only have one tone available at a time, and (b) you have to open the rig up to change tones. AES sells this module for $28.95 plus shipping.

I don't know whether this will meet your needs or not, but it's cheap, it works, and I can personally recommend it.

Another (much more expensive) alternative is to purchase Comm-Spec's TE-64, which is an external multi-purpose tone generator that is in its own enclosure and mounts external to the rig. It is big (5.25" x 3.3" x 1.7") and must run on 12 vdc. It has a front-panel knob to select the tone. The cost of this unit is $79.95 plus shipping.

Good luck and 73 de KC5NG...

This person is requesting a mod NOT a lesson on the rules and regulations. If he wants to do something illegal let him get in trouble.
It's not my problem what he is going to do with it, but here it is:

Turn the radio with the FAST and the LOCK key pressed at the same time.
then press the FAST and the ENT key to access the menu.
then go to menu 9-9 and set it to GEN then press ENT to get out. To get it back to normal repeat the steps and select 15 instead of GEN.

Have fun!

In that case it was likely audio rectification in the radios

audio amp. You'll notice this on some car radios as you pass

large trucks.

>: "AM rejection" is a spec which applies to FM radios. It is worse on

>Actually, when the circuitry is overloaded, it should limit and prevent

>AM from getting thru. Maybe the circuitry is not overloaded enough. ;-)

First, some detectors do not depend on heavy limitng.

Second, since AM goes to zero power in the modulation

trough, no limiter will totally eliminate a fully modulated

AM signal. One the AM signal goes through the limiter, it is

now a phase modulated signal. The phase mouldated signal

will be easily detected in the FM detector.

3724. Need help to design VHF fm radio

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-21 00:00:00 UTC
From: rpickeri@loyalistc.on.ca
Message-ID: <4isd1d$pe5@knot.queensu.ca>
Source record: 204242

Here is the design specks:
-freq range: 32.00 to 79.95 Mhz
-chanal spacing @ 50 khz
-at least 8 watts output
-microprocessor controled(so a number of chanels can be swithced to
quickly or changed to at pre programed time)
-preferably using an 'if' higher than the maximum frequency
(could simplify construction)
-The bottom line is lightness compactness & portability
-The basic Idea is to mimic a military anprc 77 set radio, but to do so
at considerably less weight. a 77set weighs about 30lps and it's
dimentions are about 1/2'by1&1/2'by 1'

It's bulky It's heavy and I'm sick and tired of lugging the dam thing
around

Any Ideas?

3725. Re: Can 50W HF destroy a TV?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-21 00:00:00 UTC
From: Bill Kirk <billk@conic.loral.com>
Message-ID: <4ishe8$om7@wdl1.wdl.loral.com>
Source record: 204243

The answer is "yes", but let me explain further. I run 500W, on 20, 15 & 10 to an antenna in the attic, about 20 feet from a TV set. When I first did this, I did damage to the front end and to the power supply on this, and my computer. I then added capacitors in the power line to detune it, and have a high pass filter on the front end of the TV and a low pass filter on the output of my transmitter (an IC-735 into an AL-811 or FL-2100B). I now have NO problems, except that the transmitter keys a remote control on a set about 25 feet from the antenna.

I have also used an antenna on the ceiling, but run only 100W to this, but with just the low pass filter on the output of my Tx, everything is OK, but I do worry about RF into my person.

There are several programs available for controlling Icom radios. You can find them on shareware CD ROMs (e.g. QRZ), or at some of the popular ftp sites. Also, contest logging programs like CT and NA have the ability to control Icom radios. While I haven't hooked a PC up to my 706 yet, I have connected my AEA HamLink controller to the CI-V port to use it as a remote base.

The Ten Tec Paragon ahs one of the best AM filters in the current
amateur transceivers, and its standard equipment. I think the specs
are 6khz at 3db and 11 khz at 60 db

3730. Help with repair my TS-5010 from Uniden (HR2600/HR2510)

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-21 00:00:00 UTC
From: filius@harding.et.tudelft.nl
Message-ID: <4isgtv$qem@mo6.rc.tudelft.nl>
Source record: 204248

Who can help me with my Uniden Emperor TS-5010 (like the HR2510/HR2600)

THE problem is, i have no schematic of it, so it is very hard to find the next problem:

* When I switch it on, the display is blinking, the whole thing is locked, this is because it things someone want to transmit 'at boottime'. But there isn't, there is nothing connected to it.

* It doesn't matter if i pul the PA switch.

* Pin 3 (Ptt) is only 0.17 Volt's while it should be 5V.

* I noticed pin 3 (PTT) is connected (via a resistor) to the controller (HD4074008S) pin 60. And that is the one it keeps the line down. I don't know if it in an input or an output, but if it was an input the controller chip is broken. But i don't know it, So we go on.

* Q139 measures BCE(C1815) 0V 0.17V 0V (the transistor is ok)

* The Emitter of Q139 is connected the Key input and to Q138 (via a diode and a resistor which measures 0V 0V 0V. The key input in not connected to the ground (i measure 14.5 K ohm). It look now i'm close to the solution, and it looks like pin 60 of the controller chip is an output (protection for transmittion)

* I measured the voltages on the 78XX chips and they are OK.

* Now i'm stuck, Who kan help me?

Thanks for youre time

And hopefully i can finaly repair it :)

Subject: 706 mod needed tran. in 151mhz

In article <4igi86$f9t@freenet3.scri.fsu.edu>,
timothy charles phillips <drx1@freenet3.scri.fsu.edu> wrote:
>hello,I need mods to trans. in the 151 mhz. range for work.It would
>prevent me from adding another radio and ant. to my truck.

I don't know the mod for the IC-706, but keep in mind that the
IC-706 is not (and can not be) type accepted for use in the US
Part 90 Land Mobile Radio Service. Though it seems it is very popular
to use amateur transceivers in Part 90 service, it isn't legal.

From: Jeff Childers <childers-md-nmd@anmd-usassdc.army.mil>
Subject: Advice Wanted on How To Start

I received my nivice ticket several years ago but got busy and never did anything
with it. Now I am thinking of getting my technicians license and setting up a rig.

The question is how do I go about selecting my first radio and obtaining local
assistance in setting it up? The magazines have equipment in my price range
but I don't know what features to include/exclude from my first purchase.

If you can offer advise or guidance or just tell me what you did at first and why it
would be appreciated. Thanks.

Chris:

Check out the Kenwood TS-870S! It has DSP (Digital Signal Processing). There are no extra filters required! I bought one of these for the receiver functions alone!

>
> Thanks,
> Doug

Nobody does, Doug. Per the FCC Rules (47CFR Part 90), the frequencies 464.500 and 464.550 are ITINERANT frequencies (and power output is limited to 35 watts) except within 35 miles of Detroit, MI. The FCC defines itinerant as" operation of a radio station at unspecified locations for varying periods of time." In plain FCC field enforcement terms, this means that it cannot operate from the same location for more than 12 months. Many, many stations hold licenses on one or both of those channels for "Nationwide" or "State of..." (Ohio) operation.

I have for sale a Drake UV3 tri-band transceiver. This unit operates
on 2m-220-440, 10 watts low and 25 hi. The unit is in exceptional
condition and comes with the following accessories:
Matching Drake external speaker
Slide-in mobile mounting bracket
Standard mobile mounting bracket
Comet tri-plexer (new in bag, never used).

Asking $400.00 for all. -Eric - N6ITD

The replacement for the FT-530 I thought is the FT-51R. Yaesu is
selling both at once, for some reason. I love my FT-530, but some of
the programming of unusual things is impossible to remember for me and I
have to look it up in the manual. Other things are obvious and
convenient to program. I also have two different ICOM handhelds. They are all
good products in my opinion, but the $289 price for the FT-530 is really
spectacular for such a fine radio!!!

It is a violation of FCC Rules to use a non-type accepted transceiver on
Part 90 frequencies; this prohibition includes modified amateur units.
You are jeopardizing both your own amateur ticket and your employer's
commercial license by doing this. I would venture a guess that it could
possibly affect your employment status as well!

One great use is using a transverter to get another band.....

ie: 20 meters to 6 meters. 14.0-14.35 is not much good, but 14-18 is.

Just my two cents...

> >are mostly gone.
> >This sounds like one of the many S-38 variants to me.

The real issue here, however, is the conditipon of the "rubber bushings"...these are insolatore that keep the cabinet isolated from the chassis which is HOT! This is an AC-DC set, having one side of the AC line connected DIRECTLY to the chassis. If your plug or receptacle is wired incorrectly, and you happen to touch the cabinet and a good ground at the same time, you'll probably understand what toast feels like! Forgive the shouting, but DO NOT OPERATE THIS SET WITHOUT AN ISOLATION TRANSFORMER. At the least, replace the isolation bushings with rubber or plastic to maintain the insolation. Really.

> What could be simpler? B-)

Erasing only that memory, clearing its contents would be simpler. It seems illogical that you can't do this. If you make a mistake, it stays there and all you can do is mask it...I'm with R.D.

You can of course clear all the data in memory. Just follow the instructions in the manual for enabling wide receive mode, then those for returning to ham band only reception. I can tell you from experience this will do it. ;-)

But I still like this little HT anyway.

> Any input is GREATLY appreciated!
> John, N8CID WagnerJW@msn.com

John:
The bypass relays are a real problem source with these
amps. They usually switch with each transmission and sometimes stick,
this leaves no load on the amp with full power. You can lock on the
relay, but the amp will draw about 2 amps on standby due to the
biasing of the transistors for SSB operation. A simple mode can
be made to remove the bias. I have used both of these amps and have
had both fail. Both manufacturers suffer from poor quality board
soldering. These amps are not good for more than 20% duty
cycle. Ham repeators need CCS(continous commercial service) rated
equipment, as they are on for hours at a time. Be sure to use an
isolater on the output of the Amp, this will protect the amp from
intermittant antennas, also will help intermod problems.
I have used commercial quality amps with good reliabilty, but they
are not inexpensive.

According to the QST review of a number of 2 meter rigs (in 95, I think), the FT 2500 is hands down the best for intermod rejection. I'd get one if I didn't want autodial capabilities.

I am looking at the IC-706 as a possible mobile rig. I was wondering if anyone who has/had one would recommend it, or any weakness it has.

Thanks,

N2RDD

That's because our government and big business are IDIOTS.
We have a 33 Billion buck trade deficit with China already.
And one of their ambassador staff threatened to nuke LA if we went to support Taiwan.

AT&T 900mhz spread spectrum phones are made in China and they can't retain memory... ! Went through 5 of the suckers.

They'll be a big market when we're dust...

This guy IS a rocket Scientist AND he's on the government payroll!!!

cRiTTa66 <critta66@shadow.net> scribed:

xxok, heres the story,
xxA friend and i built the "FM-25" yesterday. We turned it on and
xxnothing.. So we looked at the troubleshooting guide, "check all the
xxcapacatators for correct poplaraty" so well what do you know i
fucked up
xxon C4. So i re did c4 which is a 10uF ec. tried it again, it worked!

xxAfter a little while of use (1 hour) is just stoped. no nothing,
just
xxstatic. I was prety MAD. So i took a lot at the PCB, it looked fine,
no
xxbridges or anything. My friend lookd at it and held it in her hand..
It
xxsuddnelt worked again. After this i set it up again to play some
music
xxfrom my walkman while listinging from my stero system in my room.
after
xxthe fm-25 stoped working again is was ovious something is really
fucked
xxup with it.. but it was geting late and she had to go home. So today
i
xxwas resoddering all the parts to see if i could fix the problem...
xxIt works again. Ok this is good, then it fucked up again! Dam i was
xxpissed. so i started touching the underside of the PCB, where all
the
xxsoddering connections are. it still wasnet working. Even though the
xxlight for "freqency LOCK" was on the transmiter wan't working.
before
xxthe led would just be off.

xxi also have this problem geting stero on the fm-25 before the unit
xxcompletly broke. any ideas?

xxWell im having trouble , should i send it in to be repaired for $36?
xxOr just send in the BA1404 and the program IC's to see if there
fucked
xxup? i dono. well if you have any suggestions please e-mail me at
xxcritta66@shadow.net.

xxThanx in advance

xxPS i can be reached on IRC (undernet) on #god or #troy

David,
Just got the 3000M 2 days ago. It takes some getting used to to program but after 4 cups of coffee it was easy. So far I like it. I'll have more thoughts on it in a couple weeks. It does have expanded rx. 110-180, 300-520, 800-999 however cell is blocked. ARS is nice. 70 watts high is claimed, mine is almost 90 on high, 10 low. It has 2 cooling fans on fins instead of one. From mic you can control DTMF,tuning,menu programming, backlight,sever user programmable features, power levels, VFO.
Given a couple of weeks to get used to it maybe I'll feel more comfortable and have a better idea of how well it performs.

All you need to do to decode an AM signal is rectify it. Any transistor
junction can act as a diode junction under the right circumstances. I know
someone who gets nearby CB signals on his CD player -- no RF circuits at all,
it's being picked up in the audio amp.

: > >airline frequencies, your radio's less than discriminating tuner
: > >picks it up.There is a small, minor detail: Air transmissions were AM, last time I
: checked! How does an FM receiver with poor-selectivity receive AM
: transmissions???

It could be due to a number of factors. I ccan think of one off-hand.
The LO is being pulled by the strong signal from the airplane. When the
LO is FMed, then it appears as audio.

Ferexample. The FM station is at 105.1. The LO is 10.7 MHz higher, at
115.8. The image is at 10.7 higher, or 126.5. That's right in the
middle of the aircraft band. The signal comes in so powerful that it
gets thru the frontend with a lot of power. When it hits the mixer, it
pulls the LO and FM's it.

The only way to answer the question definitively would be to get an
aircraft transmitter and put the radio and it in a screen room, and test
try to simulate the problem. Then some measurements might give a
solution.

>Mike

Ummm...I came within a couple of milliseconds of falling into that same trap. Slope detection works for listening to FM on an AM rig; going the other way around requires imbalance in the ratio detector or discriminator -- not hard to do on a cheapie radio where the diode bridge are random diodes thrown into the board.

Nobody does, Doug. Per the FCC Rules (47CFR Part 90), the frequencies
464.500 and 464.550 are ITINERANT frequencies (and power output is limited
to 35 watts) except within 35 miles of Detroit, MI. The FCC defines
itinerant as" operation of a radio station at unspecified locations for
varying periods of time." In plain FCC field enforcement terms, this
means that it cannot operate from the same location for more than 12
months. Many, many stations hold licenses on one or both of those
channels for "Nationwide" or "State of..." (Ohio) operation.

It is a violation of FCC Rules to use a non-type accepted transceiver on
Part 90 frequencies; this prohibition includes modified amateur units.
You are jeopardizing both your own amateur ticket and your employer's
commercial license by doing this. I would venture a guess that it could
possibly affect your employment status as well!

> A possible solution that I can see would be to change the crystal to 3.61 MHz.
> This would move the birdie to 148.01, outside of the bandwidth of the radio.

Jim & Glenn-

You might consider getting a 3.561 MHz crystal, to move this birdie to 146.001 MHz. At least in this part of the country, that is 10 KHz away from the INPUT of the 146.61 repeater pair, where a handheld is seldom tuned.

As far as the effect on tones, I understand the TouchTone system has a one percent error tolerance. Therefore, the 3.579 MHz crystal could vary between 3.544 and 3.615 MHz. The 3.610 is 0.85 percent high, and 3.561 is 0.5 percent low.

The HTX-202 has another problem with the tone generator. It seems that the TouchTone signal is fed directly to the modulator, rather than to the input of the pre-emphasis network. Although the high and low groups start out having the correct amplitude ratio, they don't have it after they come out of the repeater receiver's de-emphasis network. Consequently, some repeaters can't decode the HTX-202 tones, unless the deviation is adjusted very carefully to match that particular repeater decoder. Therefore, it may not be the crystal's fault when your modified radio won't work with the local autopatch.

The FM radio I use at one of my AGA stations receives the AM
transmission directly into the audio stage - but then it is only a
matter of a few feet from the mast and its proliferation of aerials!

Mike - definitely correct this time!

Hello, all. After a number of conversations with Yaesu I have
learned the following:

1. Both of these rigs are Mil Spec
2. Both incorporate the Advance track tuning, or as their techs called
it, Tuned front end.

I am left with the following questions:

RE: The 8500

1. How is intermod resistance?
2. How easy/hard is the auto dial to use?
3. Just how well does that Smart Scarch work?
4. How much and what can you control the rig from the mike (The
new,lighted one)?
5. Overall, how would you rate the rig?

RE: The 3000M

1. How is intermod resistance?
2. How easy/hard is the auto dial to use?
3. Just how well does that Smart Scarch work?
4. How much and what can you control the rig from the mike?
5. Overall, how would you rate the rig?

Just wondering if anyone knew of all the mods for the Yaesu 51R. Or at
least point me in the right direction. Thanks

73's

>>...Alaska...ham...30 miles away...

Ask around and see if there's a repeater/users' group in your vicinity.
If you have no luck, please give me your home town and/or Zip Code, and
I'll search a couple databases I have for you.

What band(s) is your friend on???

>>What is a HTX-212?

Radio Shack's Mobile 2M Transceiver...

True FM transmit for superior audio and excellent performance on packet
30 memory channels
Priority channel selection
One call channel
Store up to six 15-number touch-tone sequences for DTMF paging or auto-patch
Microphone, external speaker and antenna jacks
On-microphone DTMF keypad
Multifunction scanning
Dual VFOs for semi-duplex operation
Frequency step selectable
Built-in subaudible tone encoder and decoder
Output power 45 watts(high) 10 watts (low)
$349.99
Frequency range (Factory)
Transmit.....144.600-148.000 MHz
Receive.....136.000-174.000 MHz

Can be modified to transmit in the MARS/CAP band. (Directions included)

It's not work on my rig (5200 USA version).
Bad luck, after I entered the code then it's LOCKED !!
The POWER, BAND, and other buttons cant work anymore.
So, I even cant turn off my rig by pushing POWER button.
I have try to push RESET button, but still can't work.

I still can dial and transmit the main freq. but can't swap
between main (now UHF) and sub freq.

If somebody kbow how to solve this problem, I'll be very happy.

BTW: I only found JP4001 to 4005 inside the interface module.
They jumperred by diodes.

Thanks

- judhi

3768. HF rig advice needed!!!

Newsgroup: rec.radio.amateur.equipment

Hello all,

I have been cleaning my shack and I am progressing from my Icom IC-728. I want the HF rig to end the hunt at least for a while, next couple years. I operate primarily CW and I do operate some digital, packet and G-TOR. I would love to hear the more experienced hams give me some advice on the rigs running between $1000-$2200 price range. I am not going to mention the direction I have been leaning but I do like the Ten Tec Omni VI a lot.

Any advice is greatly appreciated.

73,

de David, KE4FPS

This doesn't concene HAM radio per se, but I am hoping someone can advise. I have a friend who owns a bicycle shop that rents mountain bikes for tours. She would like to be able to provide a small HT to those who request it, so that they could call back to the shop if they have problems. Can she legally get a business band license (VHF or UHF) and then purchase appropriate radios to loan to customers? I'm not sure how that sort of license works. Of course, I do understand they must be comeercial, type accepted eqpt, etc. Thanks in advance.

3776. FT51-R Hacking Project

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-22 00:00:00 UTC
From: davidm@hous.inmet.com
Message-ID: <DonA9H.BC8.0.-s@inmet.camb.inmet.com>
Source record: 204170

All:

I am planning on figuring out the protocols used by the FT51-R radio and the Windows software that you can buy for it. I want to roll my own software for use on my Amiga and Macintosh computers. The maker of the current software from Yaesu does not wish to give me the protocol info nor will they support my computers. The request asked of Yaesu also landed on deaf ears. It is to bad that a company like Yaesu will not allow owners of its products to have full access to info about their products. I've run into this before. Therefore I have decided that I will be attempting to reverse engineer this protocol and will then publish my findings. I will be offering this information to other Yaesu owners for a small fee which is yet to be determined. If you are interested please drop me a line. If you can help then let me know.

I am trying to get any info as to resale value and positive
Identification of the following unit. Also would appreciate any info
on the former purpose and typical usage of this unid WWII Navy
transceiver that a friend has.
This is all the info I have. Any assistance is appreciated.

Unit is portable, battery driven self-contained, with snap on cover
with assembly directions for field use printed inside. Gives
directions for antenna setup.

radio listed as: Part #43005 Transmitter/receiver unit
possibly Westinghouse.

face appearance: amp gauge/ USN type CAY-2213-A
MA volts gauge/ USN type CAY-22291-A
1- 8 pin rec. socket
1-4 pin transmit socket
inputs for both cw key and mic.

I would like to know what this unit might be worth, and also where I
might get it assesed/repaired to workable condition.
I appreciate any help anyone can offer.
Reply via Email preferred.
Thanks. DR

>I'm doing wrong? I'll be grateful...
>
>Jeremy WA7YGB
>
>ps. My serial # is 02266
>

Having owned the radio for a year, a year ago, I think I can be of assistance...
After doing the display test Light-B-#, go into the set mode, I belive that this is function-8, look for the PL function, it will be set to 1.. Turn the tuning dial until in displays 100...

PL stands for decimal PLacement... If set to 1 (as is the default) then 1 means the you will be entering 1.000 MHz increments, whereis 100 means 100.000 MHz.
This should let you directly enter any frequency 800 or whatever...
If it still isn't receiving, then it may not be capable of getting cell, but this should at least get you out of the 440 band!

Good luck!
Steve

KAWIN NEWS

KaWin 6.36
Kantronics to distribute KaWin
KaWin FTP Site closure
KaWin News mailing list issues

Version 6.36 of KaWin, available now from the KaWin Home Page, is just a maintenance release with a few, very minor, fixes. But, due to problems with my mailer, many people missed the announcement of version 6.35, with support for the Buckmaster Hamcall CDROM.

Also, I am very pleased to announce that Kantronics will be packaging KaWin on diskette with every TNC and TNC-upgrade. This is the same shareware KaWin that is available from the KaWin Home Page and will increase the distribution of KaWin several fold.

All files that were previously available from the KaWin FTP Site have been consolidated in the KaWin Home Page. If you do not have Web access and had previously relied on FTP access to these files, send me email to that effect and we'll arrange to get them to you.

I have purged all addresses from the KaWin News mailing list that have had delivery problems. If you did NOT receive the email version of KaWin News announcing KaWin 6.36 and would like to be on the mailing list, please subscribe by email request. To add your email address to the KaWin News mailing list, send email to stan@mutadv.com with the word SUBSCRIBE in the subject line. If your email address is modified in any way by your host or gateway, please include the correct address in the body of the message. Thanks.

3780. FT5100 Mod - Extra

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-22 00:00:00 UTC
From: Dave Fifield <fifield@lan.nsc.com>
Message-ID: <31520CB2.21B9@lan.nsc.com>
Source record: 204174

I just performed the extended rx/tx range mod to my FT5100 last night. All went well until I went on the air again just to test if the rig still worked. I received reports of low tx audio level. I checked this out myself using my HT to listen to my signal compared to other people's signals....they were right. This was not a problem prior to the modification.

I thought about it for a while and concluded that the frequency sythesizer's VCO "gain" (radians/volt) must have been increased in some way by the modification, presumably so that it could cope with the increased frequency range - although, looking at the circuit diagrams, I fail to see how this could have happened! This could explain why, for the same amount of modulation signal, the deviation was now less.

The cure? Simple! Turn up the tx modulation level for both the UHF and VHF VCOs. There are two teeny-weeny pots for this on the underside of the mother board (open up the "top" of the rig to reveal them). They are on the RHS as you look at the front of the rig, either side of on of the larger surface mount chips (one of the audio op amps). You can't miss them. The one to the RHS of the chip controls VHF modulation level and the one on the left, the UHF level. Clockwise for more modulation.

They tweeked up fine, and I now get the normal "good" audio reports. Anyone else notice this side effect of the mod?

Also, something to think about is: If the mod increased the VCO's gain, then they will be MORE susceptible to noise on the control voltage. I couldn't hear any increase in the amount of background noise though, so maybe it's something you don't have to worry about too much.

3781. FT530 Mod - Any new info?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-22 00:00:00 UTC
From: Dave Fifield <fifield@lan.nsc.com>
Message-ID: <31520F07.3DC7@lan.nsc.com>
Source record: 204175

I just bought a new FT530 (closeout bargain!) and did the "green wire" modification to it. Everything went to plan, and it now does everything that the mod is supposed to do. Yes, turning it on with the up/down MHz keys both pressed DOES toggle the extended frequency mode nicely.

The question is, for the 900MHz amateur band (supposed to be able to rx from 800 to 950 right?), the radio appears to be deaf. Does anyone know for sure that the radio now really receives this band? If the PLL wasn't locked, the display would flash, right? (It doesn't). And it cannot seem to hear really loud signals that another of my receivers can.

Looking at the circuit diagram, it's not hard to see why it may be deaf up there. There are a ton of filters prior to the receivers!

Has anyone done any "real" research into this, in the lab? I may have to! Let me know. Maybe there are some other "links" that need to be sorted out as well as the green wire? What do all these links do anyway?

>on todays rigs) version. It is not small, but is pretty darned
>light. Needs 12 volts at about 20 amps to run. Very low current
>drain on receive. No microprocessors inside, except in the
>frequency counter version.

Watch out when you run it off a car battery, the Triton is sensitive to low supply voltages, causing the 723 internal regulator to drop out resulting in FM on your Sideband signal. Mine will also splatter with fully wound up drive, back it off until the power drops off 10 percent or so. Other than that an excellent rig with full QSK, must have been very innovative in its day. Still use it with AFSK AMTOR. Sounds like a good deal at US$175.

>maker of the current software from Yaesu does not
>wish to give me the protocol info nor will they
>support my computers. The request asked of Yaesu

Hi:

I also tried to get this info out of RT-Systems and Yaesu, or at least to get them to offer a non-Windows package for older DOS machines. Zero success. And I understand that there's some Yaesu corporate weenie that reads this group and claims the use of non-Yaesu supplied software would violate the warranty on the radio. This failed to impress me in the most complete way.

I'm presently beta testing EZCLONE, a non-Yaesu, non-RT-Systems programming package for the FT-51R. You may wish to make contact with:

Applied Computing Systems, Inc.
120 Longview Dr.
Los Alamos, NM 87544 USA
505-672-4003 M-F, 8am - 5pm.
505-672-4103
World Wide Web http://www.acsys.com
Email ezclone@acsys.com

I'm not connected with the company, just playing with their beta versions for DOS machines (8088/286/386/486). Very promising so far, with both a non-Windows menu version and a DOS command line version in the works. I understand they are/will be offering the package for other systems, but you'd have to contact them directly for proper data on that.

3793. Ni Cad Confusion.....Help Please.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-22 00:00:00 UTC
From: rickcrider@aol.com
Message-ID: <4itmep$lun@newsbf02.news.aol.com>
Source record: 204187

Coudn't find a Ni Cad 'faq'.....and from all the newsgroups, this one seems the most appropriate for the question.

SCENARIO:
Three identical HT ni-cad battery packs. All same brand, and approximately the same age, all 7.2v, 700mA.

On a digital volt meter, fresh out of the charger, all three register in the 8.35 volt range, a bit higher than the 7.2 volt label indicates.

Used on the same HT, all three packs are 'assumed' dead at different voltages as follows: (Assumed dead = HT beeps, throttles down, and shuts off upon keying up.)

One battery pack: Assumed dead at 6.32 volts.
One battery pack: " " " 5.65 "
One battery pack: " " " 6.95 "

THREE QUESTIONS:
1. Why would one pack shut the HT down at 6.95 volts, when another will operate it all the way down to 5.65 volts.

2. Would it be wise....or not.... to rig up a device (bulb, circuit, etc,) to further drain the battery packs down before recharging.

3. I have both a quick charger and an overnight charger. Usually I alternate the packs between the chargers each time......is this a wise practice.

I realize the Ni-Cad subject has run the gamut time and again, but any and all help on this is truly appreciated. Thanks. 73

3796. Problem with KENWOOD TH-28E

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-22 00:00:00 UTC
From: lawson_j@annecy.enet.dec.com
Message-ID: <4iubq9$vqj@usenet.pa.dec.com>
Source record: 204190

Can anybody cast any light on a problem I have with a Kenwood TH-28E 2m set.

I bought this to use here in France on 143.9875MHz, the frequency allocated to sports hang and para gliders. The symptom is that the squelch sometimes opens up even when set to minimum sensitivity. This occurs on certain specific frequencies separated by 1MHz (needless to say, 143.9875 is one of them).

What seems to be happening is that the radio is picking up the radiations from its internal clocks. If you put it inside a metal box the problem increases rather than goes away, suggesting that it is indeed the source of the emission. Another 2m set held close to it also picks up on the same frequency.

The distributer I bought it from has made it clear that I will have to sue him to get him to take it seriously. Kenwood in Paris have also indicated that they don't give a damn.

Does anyone here have any suggestions? Is it reasonable that a $500 RxTx should be unusable on certain frequencies? Is this a known problem with this model or have I got a defective one.

Anyone got any thoughts?

Thanks,
Jonty

i had about the same problem with my clipperton-l the two black leads
comming form the in and so-239 connector;s was laying across each
other and you couldn't see any thing wrong uitill I turned off the
lights and where they were touching they sometimes would arc and short
the input to the output bypassing the amp the insulation had just the
smallest hole in it where it had burnt and it didn't do it all the
time hope this helps you ,also listen to make sure the relay is
ingaging each time . 73,s jerry wa4ucf

Could be about anything. Do you have normal idle plate current with the amp keyed and no drive? Do the tubes draw plate current when the amp is NOT keyed? Does the input SWR skyrocket when the amp quits working?

3800. Molex and 100W rigs...

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-22 00:00:00 UTC
From: yee@mipg.upenn.edu
Message-ID: <YEE.96Mar22115831@picard.mipg.upenn.edu>
Source record: 204194

In the TenTec that I own, the 12V power is supplied by a 4 pin Molex connector. It seems as if the connector is rated by Molex to be something like 8-10 amps per circuit. My TenTec draws upto 18.5 amps. Doesn't this mean that the connector is being driven past specs? If so, are Molex connectors really that conservatively rated or does TenTec assume only intermittent 18.5amp draw?

That's exactly right. Most of the world doesn't give a damn about
individual rights, and it's those countries that are shutting out
American workers.

Of course, if we were willing to lower the average wage to $0.25/hour,
pass laws against collective bargaining, and beat or kill workers who
don't perform, we could be pretty competitive.

I haven't personally used any of the late model rigs, but there's a
distinct correlation on the air between higher code speeds and the
numbers of operators using Ten Tec. Maybe you'll draw the same
conclusions from that as I did.

Incidentally, I don't own a Ten Tec, but it's not for lack of
desire. ;)

Good luck with your purchase.

3807. 10m Repeater Switzerland HELP wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-22 00:00:00 UTC
From: Markus Buehler <mbuehler@hitline.ch>
Message-ID: <31537452.450F@hitline.ch>
Source record: 204201

Hello thank you for reading this message:
We, a small group of ham operators, will build a 10m repeater.
Both RX and TX are located up at about 2000 meters in the swiss
mountains.
A 10 watt beacon is ready to put up to the tx location. We are only
waiting for warmer weather conditions. It will operate on 29.660 mc.
What we are looking for:
Are there 10 m repeaters at such high locations in the united states
or else where ?
We are interested in what kind of antennas where used.
Also the lightning protection is a big problem.
Which kind of tx and rx constructions are the best for 10m
repeaters.
Any other tips are real welcome.
Thanks a lot.

You'll probably get lots of answers, but there goes...

RICKCRIDER (rickcrider@aol.com) wrote:

: On a digital volt meter, fresh out of the charger, all three register in
: the 8.35 volt range, a bit higher than the 7.2 volt label indicates.

Extremely normal :-). They've just been charged.

: Used on the same HT, all three packs are 'assumed' dead at different
: voltages as follows: (Assumed dead = HT beeps, throttles down, and shuts
: off upon keying up.)

: One battery pack: Assumed dead at 6.32 volts.
: One battery pack: " " " 5.65 "
: One battery pack: " " " 6.95 "

Is this the voltage at the battery pack terminals *when you key up*?
I suspect this is just the voltage you measure after you've taken
the battery off the radio and slapped a voltmeter on it, i.e., no-load
conditions. The radio probably shuts off based on the *loaded* voltage
when you key up. Internal resistance differences in the battery packs
probably account for these apparent discrepancies.

: 2. Would it be wise....or not.... to rig up a device (bulb,
: circuit, etc,) to further drain the battery packs down before
: recharging.

Not wise. Running a nicd battery pack down to zero is bad, bad, bad.
That'll kill it quickly. An accepted safe value is 1 volt per cell --
6 volts in the case of a 7.2 volt pack.

: 3. I have both a quick charger and an overnight charger. Usually I
: alternate the packs between the chargers each time......is this a
: wise practice.

The alternation idea is probably no problem. I've read claims that slow
charging promotes larger crystal growth (not good) so *proper* quick
charging can be better. I have no direct knowledge on this. It is
important to have a smart quick charger that detects when the battery is
full by the negative delta-V method or equivalent. Timed quick chargers
are bad. With good quick chargers, charging a partially depleted
battery shouldn't be any problem, and is much better than artificially
draining the battery to recharge it (probably a holdover idea from the
old timed quick charger days).

There are 3 main things you can do to ruin a nicd pack: 1) drain it
down to zero volts, 2) severely overcharge it, e.g., leave it on a slow

charger all of the time (nicd packs are designed to take some overcharging, though), and 3) leave it in a hot car for a long time.

3810. "Up-down converters"

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-22 00:00:00 UTC
From: 430-wc@engin.umich.edu
Message-ID: <4ivc3k$7vv@srvr1.engin.umich.edu>
Source record: 204204

Hello..

Can anyone out there recommend a company that sells up-down frequency converters? Specifically, we need to operate on the unlicensed 902-928MHz band using 144/430MHz amateur radio transceivers. The reason is that not everyone in my project group will be getting an amateur radio license before the project deadline.

Also, can anyone recommend a company that sells Yagis for the 902-928 MHz range?

Please send any suggestions to junid@engin.umich.edu or 430-wc@engin.umich.edu

Thanks for any information!

Adam

3811. WTB: TU-6 tone board for Kenwood TH-21/31/41 series

I'd like to buy a TU-6 tone board to install in my
ancient TH-21AT handheld. I would also consider
buying a TH-21BT basket case for parts, and adding
the necessary tones that way.

In addition, I need the manual for a BC-6 charger.

Thanks and 73 de KC5NG, Dean Hemphill

3812. What HF rig should a newbie buy ?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-22 00:00:00 UTC
From: jmtallon@mtu.edu
Message-ID: <4iupai$fir@maxwell9.ee>
Source record: 204206

Well, I've aquired my tech-plus license, and now I'm pinching my pennies to get a hf rig, & a 2m ht. I've got all the catalogs, but sorting out the features & jumping back and forth between descriptions and price lists makes it nearly impossible to compare models -- which brings me to my question - what hf rig (new or used) will get the job done, cheaply. Actually, I'd prefer to buy a used rig - it seems like new ones start over $1200, which is waaaaay too much for my budget. Any advice would be GREATLY appreaciated. Also, which 2m ht is the best for a newcomer ?

I know the questions are vague, hopefully you can see where I'm getting at with all of this though. Again, thanks in advance.

mean to be a smart you-know-what...

Jonty Lawson (lawson_j@annecy.enet.dec.com) wrote:

: Does anyone here have any suggestions? Is it reasonable that a $500
: RxTx should be unusable on certain frequencies?...

Only if it's a Kenwood...

: Is this a known problem with this model or have I got a defective one.

I believe the TH28, based on the experiences of 2 friends, is
particularly susceptible to spurious interference (aka "intermod").
Most small HT's are to some degree. Of course, this sounds different
than "intermod"; I haven't heard of birdie problems with this radio. My
only suggestion is the obvious one -- sell it to someone who won't have
a problem with it and buy something else. The Yaesu FT-11r seems pretty
good based on my experiences and is small. Of course, you now know what
to check for...

Good luck with it!

The TM-733A has been packaged with the new MC-53DM backlit microphone.
Kenwood has a special promotion (limited quantities) packaging the
radio with a external duplexer.

The TM-733A does not have a built in duplexer.

In <4ittut$nkf@newsbf02.news.aol.com> kd4geu@aol.com (KD4GEU) writes:

Actually I have ham rigs loaned out all over the place. No I don't have much money, but I do like to tinker and help people.

I know of at least 4 HW-101's loaned out, an HTX-100, and one of the Heath monobanders for 40m.

I paid between 20 -50 for the gear, and fixed most of it myself as a hobby, I don't use the gear at home, I do only mobile, so I loan it to someone who needs it, and has a decent attitude about it.

Right now I don't have any gear I would loan but am looking for another 101 or possibly HW-16 for a kid I heard on the repeater in Dallas. He passed his code license, and wanted to get on HF but no money. I think he is about 14, and has scrounged construction sites to find copper tubing to build 2m J poles for new hams who couldn't afford to buy or didn't know how to build, I applaud him for his charity and desire to help, unlike so many Hams these days that have closets full of equipment but wouldn't dare allow someone to look at it, let alone borrow it. You know he who dies with the most toys win syndrome, I like the t-shirt I saw the other day, he who dies with the most toys is still dead.

Yes, charity is still alive, and I am amazed how rude some of the people are on this group. I recommend to the poster to join a club, and possibly get some gear loaned to him from a club member or the club itself.

Most of my gear is loaned out local through the clubs, one (the HTX-100) is like the kid in dallas I just heard while traveling and would like to help.

I have loaned one out over the Internet, but a little different, it needed some help, and the recipient had time but no cash.

Some of the radios come back, some don't, but that is there problem not mine.

Please don't bother me with requests, as I said, I don't have any gear right now.

Give the guy a break, he started his message with Hey, it doesn't hurt to ask, normally true, but with a bunch like you who have replied, maybe it does hurt some, expecially the remark if you can afford a baby you can afford a radio, probably but it is a matter of priority, I could afford a lot of nice toys at the expense of my wife and kids, but my priority is in my family and helping others, not collecting toys and bragging about all the gear I have accumulated and will not use for

years if ever again.

You meet all kinds in this Internet stuff.

Good reasons to keep the content of posts civil are as follows...
1. Amateur Radio newsgroups end up in many Schools of all levels.
2. Your mothers house is uncensored and I'll bet you don't talk like that to her.
3. It is offensive.
4. Many Internet gateway sysops LIKE MYSELF have to spend an hour or more clearing that trash (on cross postings also!) before posting the news on packet.

P.S. To all others, If you don't like the language then don't use the "reply to" in you reader. It reposts his garbage in your titles which means all of the replys have to be deleted as well.

Thanks for using restraint.

I agree with most of the comments made here in this article. I recently purchased a OMNI-6, and after setting
it up the way I like to operate, I don't really mis my TS-940 anymore.
And the "Legendary" service, I have expericnced threw the order line, with the purchase of the "VERY"
affordable filters.

> KF6BTE

Hi Stephen,

My suggestion is to skip the dual band amp. You will be better off with a real dual band mobile radio. With a mobile radio your radio is always ready to go in the car (no hooking it up to external antenna and power). Your hand held is always ready to be taken in your coat pocket.

A handheld does not have the best immunity in the receiver. You will experience more intermod when using the handheld in your car on an external antenna.

>the repeater's input frequency and transmit on the link frequency. The link
>receiver at the main site receives the link frequency and provides audio for
>the voter, etc.

The links aren't technically repeaters. They are stations in auxillary
operation, and the links aren't usually in the repeater portion of the
70cm band, thus the stations cannot be repeaters by law.

The link transmitters may or may not be COR operated by the remote
receivers. In some systems, they are active any time the voting system
is in operation. The voter has to have information as to which remote
receiver has the best signal from the user station currently transmitting.
There are several ways to implement this.

One method, called tone or voice, sends a tone down the link except
when the remote receiver limiter current exceeds some preset value.
Then the receiver audio is switched to the link. At the master site,
the absence of a tone signals the voter to put that receiver's audio
to the main repeater transmitter. This is a first come first serve
voter, and isn't particularly good when several remote receivers are
all receiving the user signal.

Another method, called tone over voice, transmits a varying frequency
tone whose frequency corresponds to the remote receiver limiter current
(generated with a voltage to frequency converter) at all times, along
with the voice output of the remote receiver. This tone is pitched higher
than voice, and is filtered out at the master site by the voter. The voter
decodes the tone (with a frequency to voltage converter) and votes the
receiver with the highest limiter current as the one to feed to the
repeater transmitter. This works better than the tone or voice systems.

Another system, called an audio SNR voter, just feeds raw remote receiver audio down the link at all times. At the master site, the voter does an audio SNR measurement of each remote receiver and feeds the one with the best SNR to the repeater transmitter. Obviously the remote receivers have to operate unsquelched, and the links are transmitting raw noise most of the time. (If the remote receiver were squelched, the voter would measure it as having the best "quieting" and always vote it to the repeater transmitter, a highly undesirable form of voting.)

It is possible to combine audio SNR voting with squelched remote receivers and COR operated links. Then the SNR measurement will be on the channel noise of the link receiver when the remote receiver is squelched (and the link transmitter off), and thus will not be voted to the repeater transmitter. The link receivers are, of course, operated unsquelched.

This is probably the most popular system used by amateurs, but it does have some drawbacks. If the user is in a noisy location, say driving in a vehicle with the window down, the noise picked up by his microphone can confuse the voter. And links keying up and down can introduce pops in the link receivers that can confuse the voter.

Remote receiver limiter current is a better measure of signal quality, but it requires the link transmitters to be active at all times. Varients of these systems can use phone lines instead of RF links, but that can get expensive because you need a line for every remote receiver.

>checked! How does an FM receiver with poor-selectivity receive AM
>transmissions???

Remember that the poor selectivity is in the receiver front end,
allowing the image signal into the receiver. This doesn't have
anything to do with IF selectivity. Now as to how an FM receiver
can demodulate AM, if the receiver uses a discriminator, it will
happily demodulate AM too unless the signal is strong enough to
have it's amplitude variations stripped off by the limiter stage.
If the receiver uses a ratio detector, it won't have a limiter
because a ratio detector is theoretically insensitive to AM
variations. But if the ratio detector isn't perfectly balanced,
it will still demodulate the AM signal too. So either of the
popular types of FM detector can demodulate AM under the right
conditions. One of those conditions is likely to exist in a
cheaply made FM receiver using a whip antenna.

Not favorably. Think of the tangle of cables, the still poor audio
output, and the almost certainty of overload and intermod problems
with the HT plus preamp.

>The power may be comparable, and the amp also improves received signals,
>but how will the performance compare with a dual-band mobile? Does the RF
>Concepts dual-band amp have any band pass filters to reduce intermod?

No, there are no filters limiting intermod included, and the preamp will
only make it worse. Your HT is already too sensitive thanks to being designed
to work with a rubber dummy load.

>I do connect my HT to a Radio Shack Discone antenna at home and don't seem
>to have much of a problem with intermod. I know the discone isn't a high
>gain antenna, but it is definitely better than the rubber duckie!

Barely. :-) The main advantage is height, which is certainly not
inconsequential, but doesn't fully make up for the lack of gain.

>I like all of the features of my HT and I probably have to buy something
>like a Yaesu FT-8500 ($680) to get comparable features (alphanumerics are
>high on my priority list). I like the ICOM IC-2000H ($300), but it is only
>a 2M radio.

Ouch. Yes, if bells and whistles are more important than solid
communications capabilities, you're going to have to spend a ton
on a mobile rig. But if you're more interested in good communications
performance, there are alternatives which will work much better than
a HT and an amp, while not costing more than the combination of a
HT and an amp. The Yaesu FT-8500 is actually a pretty good ham rig,
despite the bells and whistles, but a Motorola Mitrek would be better,
and cost less than $100 (or a MIcor for $50, or a GE Mastr II for $75).

With the change, you could also buy a scanner if you just have to have
that capability.

Jack, the privilege they are granting you is a promise that they
won't storm your house and shoot you if you get their license and
abide by their rules. It really has nothing to do with who does
or does not have an ownership claim to the spectrum.

Governments can't grant rights, whether those rights are property
rights or any other kind of rights. Rights are inherent. Government
can only infringe rights, either via the exercise of force or threat
of force. That's all government is, the most powerful set of goons
in the neighborhood. Governments, like any other gang, wield power
by operating a protection racket, with the protection offered being
mainly from *them*.

Not only that, this modification is particularly nasty, and makes
the radio much less usable for amateur operation after you perform
it. Don't even think about it. If you must operate illegally, pick
a radio that's more easily modified for this purpose.

>life of property is in danger.

Dubious legality, and dubious utility. Who ya' gonna call? VOA?
And that's *imminent* danger, IE the boat's sinking, the plane
is out of fuel and there's no clearing in gliding range, or
you're trapped in a car sitting on a railroad crossing and the
train is bearing down. Anything less can't justify operations
that would normally be illegal. For example, you run out of gas
and coast to the shoulder of the expressway. That's not imminent
danger, though it might be possible danger, and doesn't warrant
normally illegal activities such as transmitting out of band
or carjacking a passing motorist for a ride.

A pretty good metric for imminent danger situations is to ask
yourself if you are willing to put another person in potential
danger to alleviate your danger. If you're moral, and the answer
is still yes, then perhaps out of band operation is warranted.

>2. The amateur may wish to participate in MARS and/or CAP on HF.

Legit.

>3. An amateur may want to use an HF radio as part of a VHF/UHF/microwave
>transverter lash-up, and wideband transmit may be extremely useful for this;
>the bands at VHF, UHF and microwave are larger than any HF band.

Legit.

>4. A person may want to operate on 11m. This isn't legal, of course.

The most likely reason though. :-(

It has no competitors (except separate radios), and it works quite
well. It is a better HF rig, and a better simplex SSB/CW 2m rig,
than it is a repeater kerchunking box and scanner. If you're primarily
interested in the latter, separate radios are a better choice. But if
you must have all in one, the IC-706 is the *only* choice.

>have I got a defective one.
>
>Anyone got any thoughts?

Sounds like you've found a birdie. Most radios have them in one place
or another. I can understand Kenwood's reluctance since the frequency
where you experience the problem is outside the range for which the
radio is intended, IE outside the amateur band. Most manufacturers
won't warrant their products for uses outside the range within which
they were designed and marketed to perform.

I'd guess that the birdie is being generated as a harmonic of the
microprocessor clock. You might try a gimmick capacitor across that
crystal to shift its frequency slightly, and thus move the birdie
off your frequency.

> Mike Suhar, WB8GXB
> michael.suhar@lexis-nexis.com

I used the 492 Tek spectrun anlayzer. It is a excellent instrument.
I don't remember what the options did, but some went to about 40ghz,
others had tracking generators. Look in the back of the instruction book
it will tell. These sold for $18,000 to $20,000 new. Tek still
services them. Be sure to check the brightness on the CRT's before
you put down any money. They have an excellent service record and
were widley used in broadcast television, microwave and cable tv
systems. Tek does have a factory service department that will bring
them up to date and re-calibrate them. When they come back the look
and work like new.
Cliff, W7VVA

3851. Rare Bug ??

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-23 00:00:00 UTC
From: jackl@pinetree.microserve.com
Message-ID: <4j0ene$72i@crash.microserve.net>
Source record: 204134

Was talking to a guy on 80m earlier who claims to have a bug I haven't heard of before. Actually, he just picked it up recently and doesn't know much about it. If you have info on this key, I'll pass it along.

The bug is apparently very similar to a Vibroplex, almost a copy. It was made by the Telegraph Apparatus Company in Chicago. The guy also picked up a second bug made by the same company, but he says it looks more like a prototype of some sort than a production model. I get the feeling the prototype either doesn't work very well or is missing parts.

Any info will be appreciated.

73,
Jack WB3U

3852. Mobile HF tranceiverrs??

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-23 00:00:00 UTC
From: mauricea@glo.be
Message-ID: <4j0s7h$djg@rhea.glo.be>
Source record: 204135

Hi all,

I'm planning to get some kind of mobile HF tranceiver in the near future. I've read the review in QST about the IC-706 and it didn't convince me 100% to go out and buy one.
What I would like to know is: What are the pro's and con's of tranceivers like IC-706, TS-50, DX-70....

The TS-50 has proven itself already (from what I've heard) but the others offer extra bands. Is the extra cost worth it? And most important: how do they behave 'on air'??

I'm not going to use a radio like this at home, but only mobile with a Outbacker (or similar) antenna. On 2 meter (if availlable) I would only use a quarter wave.

Thanks for replying... :-)

bye, Maurice (mauricea@glo.be)

I've enjoyed using my Icom IC-Z1A dual-band HT and have been looking at dual-band amplifiers. I seem to need a bit more power when using the HT in my car, using a MFJ-1724B magmount antenna. My HT puts out 5W on 2M and 7W on 70cm when connected to 13.5V.

I could buy a high gain antenna, but I really don't want a 5 foot antenna on my car!

RF Concepts has a 2M/70cm amp (Model 2/70G) which outputs 30W/20W for 5 watts in for $259 and has a built-in receive preamp as well. How will the HT and the amp compare to a dual-band mobile unit?

The power may be comparable, and the amp also improves received signals, but how will the performance compare with a dual-band mobile? Does the RF Concepts dual-band amp have any band pass filters to reduce intermod?

I do connect my HT to a Radio Shack Discone antenna at home and don't seem to have much of a problem with intermod. I know the discone isn't a high gain antenna, but it is definitely better than the rubber duckie!

I like all of the features of my HT and I probably have to buy something like a Yaesu FT-8500 ($680) to get comparable features (alphanumerics are high on my priority list). I like the ICOM IC-2000H ($300), but it is only a 2M radio.

3857. Chgo area classes - Novice thru Extra

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-23 00:00:00 UTC
From: dreambig@ix.netcom.com
Message-ID: <4j0uue$lft@ixnews2.ix.netcom.com>
Source record: 204140

My idea is simply this -- ham radio classes see a lot of drop-outs because the classes go on too darn long! People have better things to do with their lives than attend 6 to 12 weeks of ham radio classes.

I am looking for students and sponsors for one-day license workshops. If you know anyone interested in getting their Novice ticket or upgrading to Technician, General, Advanced or Extra, please have them call me. I will teach a one-day theory seminar & workshop for any license level -- Novice through Extra.

I've taught ham radio to about 300 people during the past 10 years from Novice through Extra and always enjoy the excitement in the faces in front of me.

What do I need to make this happen? I am looking for a club that wants to sponsor the workshops.

The sponsoring club will
1) provide a suitable room for an all-day seminar and
2) get students lined up for the classes.

What will the club get in return for their effort? Classes are a great source of new members. Classes can also be an income producer if the club wants to charge for them.
Keep the money as a donation to the club or let that money pay for a one-year club membership for the new ham. My services are free to the club and the students.

Please call me if....
* Your club or repeater group is interested in sponsoring a workshop
* You or someone you know is interested in a one-day Upgrade workshop
* You know someone interested in a one-day Novice Workshop

Sir; I have a series of catalogues that I want to sell. the list is as
follows:
HeathKit test Equipment Catalogue 1954
HeathKit Cat. 800/84 Fall-Winter 1968
HeathKit Cat 800/83 Summer 1968
HeathKit Cat 810/72 1969
HeathKit Cat 800/91 1969
HeathKit Cat 810/69 1969
HeathKit Cat 810/70R 1970
HeathKit Cat 810/71 1970
HeathKit Cat 800/11 1971
HeathKit Cat 800/40 1972
HeathKit Cat 800/28 1972
HeathKit Cat 800/70 1973
HeathKit Cat 810/74D 1974
HeathKit Cat 800/80D 1974
HeathKit Cat 810/75 1975
HeathKit Cat 804 1975
HeathKit Cat 802 1975
HeathKit Cat 803 1975
HeathKit Cat 809 1976
Electronics Dist Inc Annual Edition 1973
Allied Electronics Cat 280 1969
Lafayetter Radio Electronics Cat 660 1966
Radio Shack Cat 124 1968
Allied Electronics Cat 710 1971
Allied Electronics 1974 Engineering Manual & Purchasing Guite No 710
1974
I have ARRL Handbooks that are quite old if your interested.
All of the above are in excelent condition.

Hi Rick. I am sure that this question will get you numerous replies both the good, the bad and the awful. There is so much info and mis-info floating about on the care and feeding of Ni-Cads that it boggles the mind.

The best reference I have found (used by HP Engineers while designing portable battery packs) is the General Electric Manual on Ni-Cad batteries. Not sure of the availability of same -- but sure worth the search. Try writing to GE or check out the Library or used book stores.

3863. Need info on Tektronix 492 Spectrum Analyzer

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-23 00:00:00 UTC
From: mds@lexis-nexis.com
Message-ID: <4j11o8$gfm@mailgate.lexis-nexis.com>
Source record: 204146

I have noticed Tektronix 492 Spectrum Analyzer advertised by several used equipment dealers. I am looking for comments from those that have some experience with the 492. The basic questions come to mind. 1.) Are these still being serviced by Tektronix. 2.) Are parts available. 3.) Do they have any inherent flaws that would shorten their life and make them undesirable to own? 4.) Are the options 01, 02, and 03 desirable?

Any other comments would be appreciated.

I have observed prices vary from $5K to $8.5K, some refurbished some not.

I'd like to buy a solid-state, QRP rig that supports CW and phone. I'm
open to almost all HF bands, but am fairly limited in my funds. If anyone has
one they might be willing to part with for less than $150, then I'd like to
hear from them. I'd also be interested in some suggestions for rigs/kits
that might be under $150, and any info on what I might be able to expect
out of them. Thanks in advance, and 73.

Hey Jack, what are you going to do with the old ICOM? If you're interested in
letting it go, let me know. I don't know anything about the rig, but I'm
in the market for a solid-state rig, doesn't have to have all the bells and
whistles, that might be fairly low-cost. If not interested, then that is fine
with me. Either way, let me know what you hear, and good luck.

I have the following UHF Scanning HTs' FOR SALE:

(Please allow UPS COD/Shipping in addition to the prices)

HT #1 Bendix/King Mod #LPU4140 UHF 14 channel/Scanning HT. Covers approx. 440-512 MHz. Complete with 2 batteries, speaker mic (month old), belt clips (2), Rapid-Rate Desktop Charger (Mod#LAA0325), copy of programming manual, and 2 antennas (long and stubby UHF). Unit is in good cosmetic and working condition. This radio can be programmed by keypad (DTMF capable), cloning, or by computer. This is a great computer for multiple use, whether ham, gmrs, business/commercial, or for outdoor activity.

$550 for the whole package, including programming to your freqs if desired.

HT #2 Ericsson/GE PCS-Plus UHF 16 channel/Scanning HT. Covers 440-470 MHz. Complete with 2 batteries, Standard Rate Desk Charger, charger manual, radio user manual, original box (with serial # label), and blank product registration cards. Long UHF antenna comes with unit. Unit is in Excellent cosmetic and working condition. This radio is great for multiple use, whether it be ham, gmrs, business/commerical, or for outdoor activity.

$400 for the whole package.

If interested in any of the 2 HTs', please contact me at the following internet mail address:

pm3751s@dunix.drake.edu

Bill,

I saw your posting and thought I'd throw in my two cents worth. First off, I'm not very familiar with most of the other recent rigs, other than a few hours at field day, etc., so I can't offer a direct comparison. It is worth noting that it's typically been compared to (and done quite well against) the TS-950.

Just over a year ago, I decided I would "update" my shack -- I've been using my Drake twins for a lot of years, and those blasted radios just refuse to quit and give me an excuse to buy new ones! I'm also an electrical engineer in the RF world, and receiver performance is especially important. I read all the reviews I could find on competitive radios, swallowed hard, and ordered the OMNI VI. It was a lot of things. Yes, I preferred to buy an American radio, but not at the expense of performance -- I also choose to drive German cars. Some of the other radios had a few more bells and whistles, but the OMNI has more than I will ever use. It seems less complicated -- for example, the passband tuning is simple and works very well. Others may use 2 or 3 controls to do the same thing. I also wanted a high-spec radio that would run on 12 volts.

The receiver is truly fantastic, especially in digging out weak signals VERY close to strong ones. Several times, I've worked an S2 station on CW, only to tune off and find a 40-over-9 station a couple of kHz away. The filters (all of them) are simply spectacular. Full break-in CW is one of Ten-Tec's big things, and it is faultless -- and quiet. It's a great SSB radio as well -- that DSP automatic notch filter really works -- on 40 meters,the broadcast stations' heterodynes simply disappear (too bad it can't get rid of their sidebands, too). You do have to remember to turn it off for CW though (yes, there is a LED indicator) -- it "changes" everything into "dits" -- that's one of those "cockpit errors" you make once. The manual notch filter is the first I've considered worth bothering with -- it works well and it's dead simple to tune. You don't have to read the manual to use the its features (especially important for those of us who occasionally ignore our radios for months at a time). I've used the OMNI in a lot of different situations - DXing, contesting, ragchewing, even portable running off the car battery, and it has never disappointed. I tried it on RTTY, and it worked just as advertised (you do need an external fan on the heat sink, but it will handle continuous "key-down" operation at full power without complaint). You can transmit into anything (or nothing), and not worry about permanent damage. It will put the whole 100 watts into a 3:1 VSWR (or worse) without folding back, and with no ill effects. It's not a small radio, but it is very light (aluminum chassis and no internal power supply).

The radio has performed flawlessly, and I haven't had to use their "legendary" support. They did send me a letter a couple of weeks ago, offering me an upgrade for the firmware -- not a fix, just a couple of new features they've added. It cost all of $15, and they sent out the EPROM chip yesterday. I'll replace it this afternoon -- an operation I expect to take five minutes, tops, including finding a screwdriver. They have made a couple of minor changes based on comments in magazine reviews. For example, the tuning rate (main and RIT/XIT) can be set, and the crystal oven is on whenever 12V is applied to eliminate 2-3 minutes of noticeble warm-up drift when the radio is switched on.

About the only negative thing I'd say about the radio is that it doesn't "look" quite as good as it is. It's solidly built, but in terms of styling it appears a bit on the Spartan side. The display isn't as sexy as some of the rigs with vacuum fluorescent displays (but it is BIG and readable) and the S-meter looks a bit "chintzy" (it isn't). The knobs could use some texture, and the case could use a bit of styling. All of these comments are cosmetic. Basically, I'd recommend the radio to anyone. It has the performance for contesting and DXing (it's a lot better radio than I am an operator). At the same time, its features don't get "in your face" and make it complicated for everyday rag-chewing. If you call the number in their ads, they'll send out a package of info. They have a web home page, but there's not much there yet.

If you have any specific questions, please feel free to email me. And no, I don't work for Ten-Tec (or know anyone who does), and have never set foot in Sevierville, Tennessee.

Vy 73,
Don K9DM

You people are a bunch of pretentious old farts. So the guy gets a
little frustrated and says he accidently FUCKED UP his transmitter. Big
deal. That's the way alot of people really talk. The Internet is a
common meeting place, that is not censored (at least not yet) and if you
are going to get so bent out of shape over a little bit of profanity,
you are not going to be able to reap the advantages of the net. So get
real, okay? He's not really that bad...

Hello Jonty,
I have a TH28a and found that while band scanning it would stop on certain freqs
due to the "birdies". It seems that all wide banded recievers act like this and its
a trade-off for having the capabilities it has. You may also notice intermod interference
when connected to an outside antenna.

This has 8 or 9 octal tubes in a big black airtight box that gets QUITE warm in an hour or two of actual use. I had one I used for SWLing; I made a line operated supply to replace the original dynamotor. It is very solid mechanically, but would drift some 20 kHz while warming up. I would say you would need an external I.F. and detectors for SSB or CW modern use, and also to fix the problem of the 915 kHz IF being much too wide for ham use. I wanted tu convert it to FETs, but a visiting student fell in love with it and I sold it to him... with all the info!

From: K5ESW@nando.net
Message-ID: <4j3j6o$p9k@castle.nando.net>
Source record: 204011

I am interested in the QRO HF-2000 amplifier. Someone saw it at the Charlotte hamfest and said it was very quiet (fan and QSK) and very well-built. It is an instant-on amp using two 3-500C tubes. Price is $1895 with vacuum relay QSK.

The specs list the output power as 800w RTTY, 1250w CW, and 1500w SSB. Drive power: 130 watts for 1,500 watts.

I have seen a positive review of the amp in The DX Magazine by W1ZK. The review mentions the quiet, 49 CFM, muffin fan. It quotes the designer as saying the fan is sufficient for full-power SSB and 1200w (80%) CW operation - you can place a low-speed muffin fan on top of the amp to help draw out hot air if you anticipate higher levels of operation.

Does anyone have experience with this amp?
I am interested in comments from users and what output you get on different bands with 100 watts drive.

Paul Ferguson

Source record: 204014

Anyone working on modifying a HT220 to work on 220mhz?
My friend and I are working on this conversion as a cheap
solution for 220 usage.

Up till now all we have accomplished is getting it in band by
reducing the value of the capacitors in the network by half.
But the power output loss is great and leaves its output at
about a half a watt!

Anyone?

>keeps bitching about it.

Absolutely right! If you are REALLY offended, send a copy of the offending post and subject line to "postmaster@ offending-party's-ISP", detailing your complaints in a concise and rational manner. Point out that the newsgroup in question is one in which such stuff is wholly unexpected and in which young hobbyists participate. With the threat of government involvement on the net, no-one needs some jerk inviting trouble and the ISP may be even more interested. and ask his assistance in correcting the problem. Most ISP's will crack down on an offending user who generates any volume of complaints at all. If you want to get under the offender's skin, just give him a cc of the e-mail complaint to the ISP; it would be the courteous thing to do anyway. Anotehr tactic 9which I do not endorse) is to e-mail back to the offender a copy of his offensive post. If enough unhappy newsgroup participants do this (some guys do it over and over and over and ...) his mailbox will get full REAL soon. But, as I said, THAT WOULD BE WRONG!!!

3883. FS MILITARY COMM SHELTER UNUSED REAL NICE

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-24 00:00:00 UTC
From: louis@postoffice.ptd.net
Message-ID: <4j2q4b$1rm@ns2.ptd.net>
Source record: 204016

I acquired some military shelters that I had planed a use for, but I did not ever see the project through. I
am selling these shelters and thought you might like to check out a few photos of them. If you click on the thumb
nail you can see the larger picture in 800 x 600 resolution. The shelters are rated to block Rf frequencies
up to, I believe, 1.3GHz and at 120db of attenuation. These would make Ideal radio repair rooms. The construction of
the units are double aluminum clad over a foam core with an outer kevlar skin (Bullet resistant!). In pictures 8 and 9 you
will notice that the shelter can be used with a 40 foot Wil-Burt pneumatic 9 section mast. I am selling these masts separately
if desired. If you would like the shelter with out the mast I can reduce the price some what. These masts are like the
ones on the news vans, except that these are built to Mil Spec and the original cost to the defense contractor was $20,000 each.
Don't worry that is not my asking price.

I will sell you the mast separately for $2,500
I am asking $5,000 for a shelter with a mast, and I am asking $3,500 for a Shelter with out the mast.
If anyone would like more details, I can be reached at (717) 629-7212 ask for Louis or E-mail louis@postoffice.ptd.net

To see photos of these shelters use your web brouser and go to this URL

Rick and Jeremy,
The reason that Yaesu is selling the FT-530 so cheap is, (1) They are
discontinuing this model, (2) they are comming out with a new dual
band HT, model FT50R. This new radio will utilize the FT-10/40
accessories.

Buy the Alinco if you want to get into the repeaters. I built a Ramsey kit several years ago. The rx sensitivity was poor, my computer and TNC interfered with it big time. I enjoyed building the kit - it makes a FAIR packet radio (if your TNC doesn't get into it.) Better yet buy a used mobile on the net. You can get a fairly modern one in the $200 + range.

Dave

I bought the DSP 232 back in DEC 95. Just receive it last saturday. I made
many inquiries as to when it will arrive. I found the same situation too.

Although I have only had this for a week I can tell you that if I had to
do it again I would never had sold my KAM PLUS. I miss the dual ports and it
does not seem to be as (sensitive ?) as the KAM PLUS. Really disappointed.

> > favorably with the competition.

I sold my cherry Kenwood TS-850SAT last October when a lightly used Omni VI became available to me. Here's a list of some pros and cons compared to my 850, based on my experience to date.

Cons:

1. No built-in CW or voice recorder available (CW recorder was standard on 850, voice recorder was optional). Nice during contests. Of couse you can automate using CT for CW and your Soundblaster for voice if you have a computer.

2. Ham Bands Only - No general coverage (ho-hum) and CANNOT be modded for MARS operation (my only big disapointment).

3. Cosmetic appearance is, well, very "different" than the slick rice boxes. IMHO, looks like the product of an professional homebrewer on steroids. After an awkward first month, I decided I love the look. Big, but surprisingly light.

4. No built-in antenna tuner option (not really a problem, since the finals are more forgiving than anything else I've used. The tuner in my Kenwood 850S/AT was a joke. I bought a used 2KW Dentron for when I need to tune stepladders and rain gutters.

5. Audio quality of the Omni VI is good but I have never had anyone tell me I had "great audio", which used to happen fairly frequently with the Kenwood and same mikes. No "on-air" monitor function.

6. Menu system for system options requires a lot of key presses for some frequently changed parameters. I like to use different tuning rates for CW and Phone...the tuning speed option is the very last in the menu. They should have put a fast/slow button on the rig like the Paragon.

7. Have managed to lock up the rig two times in six months under computer control, requiring a full system reset.

8. For my money, the built-in speaker is awful...distorts badly at high volume levels (more than the Kenwood). Hooked it up to a $10 8 inch external speaker, which eliminated the issue. The matching power supply/speaker has the same

tiny speaker in it. If you use cans most of the time, no big deal.

Pros:

1. Easier to operate than any other rig I have owned.

2. Best dynamic blocking factor I have ever experienced (awesome weak signal performance).

3. Great service...I have called to ask some questions a few times and have gotten a tech immediately each time...no irritating voice mail system either. Very reasonable upgrade policies and the rig is laid out open enough that you can actually work on it yourself if you are so inclined.

4. Built-in computer interface (compatible with Icom CI-V system). Since my 2-meter all-mode rig is an ICOM I can control both the Omni VI and my 275H (plus 2 more ICI-V compatible rigs) with a single ICOM CT-17 interface. Way cool!

4. Excellent filtering - I can count the times I've turned on my Timewave DSP-59+ since I got the Omni on one hand.

5. American made - 'nuff said

In summary, best radio I've ever used. Won't even consider parting with it unless they come out with an Omni VII some day, and even then it's only maybe.

Never had much luck at sweeps until I ran the Omni last November. Under so-so conditions with a modest station (barefoot Omni, Cushcraft A3S at 35 feet) I was one short (North Dakota - go figure) of a sweep with only moderate effort. I credit the Omni's weak signal performance with much of that success.

If you're looking for a rig with more bells and whistles than a Mississippi riverboat you can look elsewhere. I you want the best raw performance in an amateur band radio for the buck buy a Ten Tec Omni VI and don't look back.

Hi Larry. I have owned a TS-850SAT for several years and have had no
problems with the rig other than having to readjust the master oscillator
periodically. Kenwood offers a pricey Hi stability oscillator though.
Features I particularly like are as follows:

Quick Memo for temporary storage of frequencies -- great for DXing and
arranging QSYing.
CW Reverse - works well in CW pileups
RF Power Control -- mine reduces power to 5 to 6 Watts so I can play QRP
(106 QRP countries worked with TS-850 and an R5)
Speech Processor and High Boost really pumps up the highs for busting
pileups (with MC-80 Mic).
Allows the use of the Kenwood Bandscope which I find very useful (RTTY
Tuning and spotting band activity and checking TX output)
Auto Tuner works well. Won't load a wet noodle but surprising what it will
load up into.
Excellent audio reports.
Tune button for zero beating is a nice feature.
Fine button for critical tuning i.e., Digital signals.

My voice recorder module works well for contesting.

RE: The feedback problem on the digital mode. I first used the audio
inputs on the rear panel and experienced feedback problems, so I feed the
AEA 232MBX FSK outputs to the FSK inputs of the TS-850SAT and have no
feedback problems with that configuration. Got to compensate for frequency
readout however.

The TS-850SAT has BIG final stages and it will run all day at 100 Watts
without over-heating. Some have adjusted the output up to 200 Watts but I
would not recommend same. Had to tweak mine slightly to get 100 Watts out
on 10 Meters. Easy to do.

Allows AM and FM operation -- the AM is so so. FM works well.
The TF-Set button is great for working a split pileup - allows u to listen
momentarily to the freq u will TX on.
The RF Power Control is handy for adjusting the drive to a Linear.

All in all a great rig, but I am sure the Icom, Ten-Tech, Yaseu and others are excellent as well. Ford, Chevy, Plymouth -- take ur choice. Go to a buddies shack and operate them for a coupla hours -- see if the rig likes you and vice versa.

Some "entry" level radios have no RF Gain control -- I won't be without one. I usually set the RF Gain down a bit and the audio gain up -- helps the subjective noise level. Old CW ops trick.

Kenwood puts the RF and AF Gain controls on the right hand side and I'm right handed. Others are left handed radios HI HI. A minor point.

With the advent of the DSP Radios -- the TS-850 is not the latest in technology. Not sure what DSP Radio I would buy until I could operate and check them all out. Was not overly impressed with the DSP stuff I have tried but haven't used them extensively.

Anyway some impressions from a user.

Good luck
73

>Lonnie

Reduce the power Lonnie to peak the meter. All the Artificial ground does
is reduce the reactance of the ground lead. Once it's tuned for maximum
meter reading, you're all set. I *think* there is a pot inside that sets
the sensitivity, you may ask them. If there is, turn it down.

Even if you have a "balanced" antenna, you still may have RF problems.
Thay can occur when the feedline isn't properly installed, such as coax
feeding a dipole.

In that case, a CHOKE TYPE balun will help things. The choke balun can be
as simple as several turns of coax in a single layer winding several
inches in diameter to as complicated as a string of ferrite beads over
the cable. It will help a great deal with RF in the shack.

What type of antenna are you using?

Ryan,
Since you are surfing the internet, search for Ham Radio Outlet home
page. There, you will fond ArtSci info. ArtSci publishes a book called
"Lost Users Manual". It has alot of good info in it. It should show
you how to operate your radio. It sells for $19.95.

There is no way of getting around storing the same frequency over and over
when your in the AUTO-store feature. The main difference between the 2035 and
the 2042 is the 2042 corrects the problem of storing the same frequency over
and over again.
There may be some other minor differences but this is the key one as far as
I'm concerned.

Hi netter,
Cound someone advise how to expand frequency ranges for the Yeasu
FT-729 and FT-2500M? My FT-729 used to have extended receive range when
I brough it. Borrowed to someone and seems to have accidentially reset
it. It now loss all programmed frequency memory and cannot receive on the
800 to 900 MHz band. Any help is apprecaited. Please email reply.
Thanks in advance

>and cost less than $100 (or a MIcor for $50, or a GE Mastr II for $75).
>With the change, you could also buy a scanner if you just have to have
>that capability.

C'mon Gary! The suggestions you have given here are 180 degrees from what Stephen is looking for. You think you're helping?

Sure you can buy a Micor for $50. But then you are limited to the channels you have put in it. And elements will most likely cost you at least $50 a set. And since I have never seen any of those radios with "dual band" features, he's gonna need two (no room left in the trunk for luggage).

I agree that alphanumeric displays and other bells and whistles are luxury items that should come second to performance - and even then, I question some of their real value. But I think that "solid communications" can be had for $400 in an amateur rig. You also get versatility that you don't get from a commercial rig. But then for $200, this guy might get what he wants with an amp - and depending on how he installs, it could be clean, neat and easy to use.

IMO - About the only thing you gain by going to a Micor/Mitrek/Mastr type of radio is ruggedness. But most hams treat their radios with more care than the average refinery/pipeline/contruction worker, so I would go with frequency agility, power control, ect. My only use for commercial gear in ham radio is fixed stuff - repeaters, etc. - they're good for that.

Message-ID: <4j4gdg$qbq@newsbf02.news.aol.com>
Source record: 204035

AOR-1000XLT Super Scanner/Radio
Pre- Cellular Ban Version
Freq. Range; 500khz to 1300mhz Continuous Scanning
1000 Memory
Modes: AM-FM-WFM
This is a great chance to get a radio that does not require a special converter, or a custom internal modification to restore that censored 800mhz band... Not that anyone really listens to that band.<g>
The radio is like new-mint-excellent condition. Very little actual use. Would prefer someone from the Atlanta area, that way they can see it, touch it... smell it if they like. Just so you know that your getting a radio that is in new condition at a fair price. But, If not Atlanta area. I will at least ship this radio to you 2nd day, that way you won't have to wait to use this great pup.

You ask, if it's such a great radio. Then why am I selling it? Courtesy of Blue Cross/Blue Shield HMO, I have some mounting medical bills that have to be paid... like really soon!

What I need to get is about $350 for this radio, so if your interested and can help out. Please let me know. Thanks

btw, this unit has all the original accs. and the box, all in new condition... that you could place it on a shelf an re-sale it?

Hello, all. After a number of conversations with Yaesu I have
learned the following:

1. Both of these rigs are Mil Spec
2. Both incorporate the Advance track tuning, or as their techs called
it, Tuned front end.

I am left with the following questions:

RE: The FT-8500 and the FT-3000M

1. How is intermod resistance?
2. How easy/hard is the auto dial to use?
3. Just how well does that Smart Scarch work (3000 only)?
4. How much and what can you control the rig from the MH-39 , MH-36 mike?
5. Overall, how would you rate the rig?

Source record: 204041

I treated myself and My ICOM 729 to a Heil headset with boom mic using the HC-5 element. ICOM uses electret condenser mikes that appear to have a pre-amp in the base while the Heil unit is a crystal unit that has no pre-amp.
To get 100 watts out of my rig, I hav to run the mike gain WAY UP HIGH. Anyone got any tips? I really like the headset as I do a lot of CW operating and the bom mic makes it handy but I am concerned at the high mike gain I'm running.
Am thinking about building a small pre-amp to put between the Heil and the ICOM.

> +--+
I have the FT-11 which is the 2-meter only version. I like it. I also
have the Yaesu FT-470 which is pretty universally considered to be a fine
rig. The keypad on the FT-11/FT-52 is like the FT-470 and, as such, it
is easy to use. The keypad is close ot normal size so I find that I
don't fat-finger the keys as I have done on other rigs where the keypad
is tiny. Also, the ADMS-1 software that lets you program the thing from
your computer is slick. Power is a little low but and the small antenna
could use some help. Of course, if you want to work DX on 2 and 440, you
shouldn't get a handheld.
Bottom line: I like my FT-470 and my FT-11; I suspect you would find the
FT-51 a good piece of equipment.

> >>additional test deleted<<<<<

As Tom, W8JI stated, a circulator may be the answer to your troubles. If your repeater is located in a "high rf" area, ie a commercial tower, etc., there may be enough rf coming IN your antenna system to send your amp into oscillation. A circulator (aka isolator) will send the incoming rf to a dummy load and keep it away from the amp. It's also a great way to keep signals from mixing in your equipment and producing imd products that could cause interference to your system or someone else's. Many years ago I had a similar experience when I ran a 2M repeater for a local club. If I only knew then what I know now, it would have saved me untold hours of repair work and frustration. Spend the money and get an isolator, it's worth every penny.

>are, of course, operated unsquelched.
>
AHh excuse me Gary but a TRUE Voter doesnt require UNSQUELCH link rcvrs
nor do the link have to operate all the time!

The remote rcvrs (which are linked back either via phone line or 222.15
or higher RF links) can operate either COR or PL. They can either send a
tone down a phone line (typically 1950 Hz in voter systems) or
nothing...and let the voter detect activity either via VOX, loss of tone,
COR detect off the link rcvr, etc.....and then it votes..

I use a 4 channel voter on a commercial system I maintain...and it uses
the methods I describe above...And two of the rcvrs are fed in via a
6Ghz microwave system....
NOONE uses the tone over voice mode anymore...SNR voters have gotten to
the point in price where it isnt worth bothering with anything less
anymore...

Also you made a comment in your article that was slightly incorrect...
You stated that links operate outside the rptr band in the 440 band and
therefore cannot be rptrs...this is incorrect....AUX stations can operate
ANYwhere in the 420-450 band (except 431-433 and 435-438) and SO can
REPEATERS (check your current copy of Part 97....Repeater subbands
on 442-450 has been gone for almost 20 years...since the elmination
of the WR calls and other rptr rules)....a crossband rptr from 2m to 430
Mhz is perfectly legal...now whether it is any good is another
question....yes, the remote rcvrs CAN be crossband rptrs....but in most
cases, it is best to CALL them and operate them as AUX stations....

>on my car!

My first suggestion: If you have any fears about drilling a hole in yout car, get over them :) . Install a real antenna. I am not saying that you have to have a high gain antenna - I am saying that you should forget magmounts with HTs (or anything). Magmounts just do not perform as well as a good roof mounted, drilled into the sheet metal, with a good bond to the car right to the car at the base, antenna.

You don't need a five footer. A unity gain (3 dBi) antenna on a good roof mount works great in California where a good number of repeaters are on hills or mountaintops. You may find that just going to a better antenna installation will give you desirable results without an amp.

My only use for magmounts is when I need a radio on a temporary basis in a car that doesn't belong to me.

>
>The power may be comparable, and the amp also improves received signals,
>but how will the performance compare with a dual-band mobile? Does the RF
>Concepts dual-band amp have any band pass filters to reduce intermod?

You don't need the preamp. With some exceptions (this not being one of them), preamps at the radio end of your coax are pretty worthless. Most of your Yaecomwood HT's have sensitivity at or below 2.5uV. Even with loses through ten feet of coax in your car, with that kind of sensitivity a preamp will not buy you anything.

[snip]

For the most part, those of us using VHF/UHF FM radios are using them to work repeaters. You don't usually need a lot of power to work a repeater.

I would say - if you got the bucks, buy a mobile. But if anything at least use a good mobile antenna system.

If you want extra power (and sometimes you'll want it), and you don't want to spend $600, buy the RFC dual band amp and install in it you car so that all you have to do is connect a coax to your HT and start talking.

3922. Icom IC-02AT Handi Talkie for sale (revised)

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-24 00:00:00 UTC
From: pwest@atl.mindspring.com
Message-ID: <4j4hjv$aoo@firebrick.mindspring.com>
Source record: 204055

After looking around the newsgroups awhile I have determined that I have been asking too much for my Icom IC-02AT (2 meter) talkie. In the past I have been advertizing it for $200.00 but I am now dropping it to $150.00.

The radio is in perfect shape and has been modified for out-of-band coverage (this is the LCD display radio, not the thumbwheel radio). This radio has tone and 10 memories. I am selling it with 2 antennas (one is a stubby) and two battery packs -w- a wall charger.

If anyone is interested please leave me mail at pwest@mindspring.com.

Thanks
Phil (N4NBL)

>
>----------=?> Doctor Who <?=----------
Nobody said that that the author of the profane article was "bad"
nor made any personal attacks in the newsgroups that I follow. Does your
comment reflect YOUR true feelings - that he is "bad"?

1.) Talking and broadcasting are two very different activities. One
usually knows exactly who they are talking to, but not who is listening to a
broadcast. Therefore, a little more restraint is in order for the latter.

2.) He did not just say he ____ed up his transmitter, he said it over and
over again. Not only that but he went into excessive detail about things
that had nothing at all to do with the radio problem to the point of
distraction.

3.) Your only as old as you feel and I feel pretty young.

4.) Compared to other resources, the "net" is more full of chaff than
wheat. Anything we can do to change that is a positive. Did the profane
post elucidate anything for anybody?

Does anyone know if the MFJ Artificial Ground really works. I've followed the directions to the tee and can't get the RF Ground Current meter to come off the peg. I'm starting to wonder if it's really worth having. My problem is, my HF station is on the second story of my home. So a short ground is not possible. I was told that if you connect the ground to this unit that it can be tuned so that RF gound would appear to be right next to the radio. Anyone's thoughts please...

The Raymond Sarrio Company's Ham Radio WWW site is proud to announce a FREE Ham Radio classified advertising page at http://www.csz.com/sarrio.html. This new classified section will include Hams to search for equipement with the help of a search engine--no need to scroll through 100's of listing before you find that special piece of gear. Plus, when you find the gear your interested in, each listing comes with point-and-click e-mail access direct to the Ham that listed the item.

For those Hams with gear to sell, take note! It is absolutely FREE to list your equipment within the Ham Classifieds, and there will be no posting time delays.Your posting will go on-line, in our classified search engine,in about 1 hour. All you need do is fill out a simple forms page, and upon its (point-and-click) submission, your "For Sale" advertisement is on-line.

I will be purging the classified listing initially about once every month, but that timeline will shorten as our classified numbers go up. Give it a try, and let me know how you like it. 73's Ray

From: Icecold@youngo.demon.co.uk
Message-ID: <31549e13.997570@news.demon.co.uk>
Source record: 204090

Hi all, thanks for reading!

I am trying to build a device which will send a signal from a transmitter to a reciever, simple as that!

What I need it for is this :-

I need to connect a jack lead from the monitor out socket of my mixing desk, to a transmitter, which will then transmit to a reciever which will be held on a trouser belt or in a back pocket to which a pair of walkman headphones will be connected.

Thus creating an " IN EAR MONITORING SYSTEM" for stage, theatre etc.

In the UK (where I am based) I have been quoted as much as almost
£2000.00 for this piece of equipment, which to me sounds astronomic!

Can anyone point me in the right direction as to what I would need to build this device or where I should start looking?

Any help on this would be a real help

Cheerz

Ice!

PS The transmitting range would be no more than 20ft and I would prefer radio rather than INFRA RED!

Be aware that NimH batteries need different charging techniques than
Nicads. Their self-discharge is worse too.

>which 2m ht is the best for a newcomer ?

Let me suggest a few rigs to you. For HF, the IC-735 is still
a winner. It had the longest production run of any amateur
transceiver, which says a lot about its desirability. And
you can't have mine, which says even more. Street price for
a clean one is around $600.

For a 2m HT, new would be the Radio Shack HTX-202. It is about as
close to intermod free as new HTs get. When it's on sale, it's
pretty price competitive too. For a used HT, I'd recomend the old
workhorse Icom IC-2AT. It doesn't get much better than this short
of Motorola, and you can find them for around $100, a bit more with
accessories like the BC-35 and spare battery packs. No built in CTCSS
though, if you need that, look elsewhere. Another alternative HT is
the Yaesu FT-470. This is a dualbander, very simple to operate, and
you can find them for a bit under $200. More intermod than the
IC-2AT though.

>quarter wave.

I looked carefully at these three radios before buying, as well as looking at the somewhat larger Yaesu FT-900AT. If raw HF performance is paramount, a built in tuner is important, and you have the space, then the FT-900 deserves a careful look. But if you want 6m and/or 2m, and space is at a premium, then it's not for you. Even the remote head is big and busy by comparison to the others in this class. I give it 3 stars, mostly for the crunchless receiver and AT.

The TS-50 is a... well it's a Kenwood, nuff said? It goes to the bottom of the list. I give it 1/2 star.

The Alinco DX-70 is a nice compact radio, with 6m but at reduced power. It seems to perform well on HF, and is fairly easy to use. It's a bit of a challenge to mount in a mobile, but not bad. The display is a touch small for mobile use too, but again not bad. The controls are a bit small, and the panel is busy, but not too bad. The price has just been cut too, and that's not bad either. I give it 3.5 stars.

Then there's the IC-706. Icom says it has outsold any HF rig they've ever introduced. It's tiny, and with the remote head you should be able to find a way to mount it even in a Bug Eye Sprite. It covers 2m, which the others don't, and it is full power (100w) on 6m. The display is very readable in the car, and the simple menu system makes for an uncluttered panel that quickly becomes second nature to use. I'd rate the ergonomics for mobile operation as first in class. I bought one.

Now it is not without flaws. It comes with a SSB filter and a slot for only one optional filter. I installed the 500 Hz filter for digital

work. There's a trace of filter blowby due to the lack of cascaded filters. And the front end is not uncrunchable. There is a preamp and an attenuator, you'll be using them fairly frequently if you have a good antenna. In the car, this is less of an issue for HF since no antennas are good. It is an issue for VHF. The noise blanker is only so-so. The built in keyer chops dits in QSK mode, if that matters to you. It doesn't to me.

The fact that it has fast TR does matter to me, however, because of digital operations. It is a digital operator's dream machine for a number of reasons. It will shift the narrow filter up to the correct position for digital tones, and back down again for CW operation. It has a real RTTY position, and will accept real FSK keying as well as AFSK. It offers a *slow* tuning mode, which in conjunction with the already tiny tuning step makes tuning in modes such as Clover a breeze. It has IF shift, and has the neat feature for the CW operator of letting you move the filter to either side of zero beat to get away from a nearby station on one side.

Of course it offers 2m too, but that's a mixed bag. First it is only 10 watts on 2m. Second it doesn't know about the US 2m bandplan for repeaters and setting plus and minus shift is awkward. Figure on programming the memories and operating repeaters that way. It has plenty of memories, and they're easy to use. And it does include CTCSS. Third it *will* crunch, here is where you'll exercise the preamp/atten button a lot. Or perhaps not, I've found that operating with both the preamp and attenuator off is satisfactory most of the time, and when you do need them, they're there, unlike some rigs. But the NF is good, and if you work satellites or weak signal simplex it is a suitable all mode rig for that (an external amp is warranted). Intermod is low inside the 2m band if you exercise proper care with the preamp/atten button. Its wide coverage reception outside of 2m, however, is not so good. You *must* mod it to get acceptable performance. There are two mods floating around, one gets you up to National Wx, the other all the way to 200 MHz. The former is easy, the latter requires a bit of SMD skill. The mods let in the pager crud when tuning outside 2m, as you might expect, but don't affect operation inside 2m.

It has programable power levels, which make the lack of transverter jacks bearable, and should also make the QRP operator happy. And nearly everything is computer controllable via the CI-V interface. It has provisions for driving two different types of autotuner, and has an accessory jack that brings out nearly everything you could think of wanting to access. FSK is a separate jack. And there are two mike connectors and two headphone/speaker jacks, one set on the back, one set on the control head. That's very very nice. The headphone jacks are already set up to feed mono to stereo headphones, a nice touch. Unfortunately, the supplied microphone is not quite so nice. It lacks a Touchtone pad, and some operators have complained of low audio and lack of bass, though I've gotten glowing audio reports from mine. Changing to a mike with TT is a priority for

me, however.

The out of band transmit mod for HF is simple, making use with transverters a cinch, but forget out of band transmit on VHF, not even just a tiny bit out of band for CAP. It receives AM air band well, and WBFM so you can tune the FM broadcast band, and receive VHF TV audio, but it doesn't do stereo, and the IF filtering for the WBFM IF is non-existent. Separating near/far adjacent channel FM broadcast stations can be a trip.

I seem to be dissing it, but it really is a wonderful radio, which only serves to make its small flaws stand out even more. It's so generally good that you expect it to be perfect, but of course it isn't. I've been using it side by side with my old faithful IC-735 for a while now, and while I won't be selling my IC-735, the IC-706 holds its own in the comparison. Some things it does better, some things it does worse, but on balance it is a worthy successor to the venerable IC-735 as the mobile operator's rig of choice. I give it 4.5 stars.

I do have a list of things that Icom could do to make it a 5 star radio, however. Easiest would be to ship it with a TT mike and a *schematic*. If you can believe it, the radio doesn't come with schematics. I find that unconscionable in an *amateur* radio. The service manual is good though. I'd revise the firmware so it understands the US 2m repeater band plan. And I'd put a decent filter in the WBFM IF and allow a VHF CAP mod. I'd fix the wide coverage VHF receive filter so that it actually works over the tuning range without requiring SMD rework. And I'd junk the IC VHF preamp and put a good GASFET preamp in it with a high third order intercept so I wouldn't have to play games with the preamp/atten switch downtown in intermod alley. For the CW op, I'd get the dit chopping fixed too.

Maybe if they did that, they could call it the IC-706A, and everybody who had already bought the IC-706 would rush out to trade up to the new improved model. :-)

What sort of antenna are you using? If you're using a balanced
antenna, IE dipole, then there should be no RF in the shack, and
there should be no indication on the counterpoise tuner's meter.
That's what it really is you know, a counterpoise tuner, and it
is only useful if you're using an unbalanced antenna that *needs*
a counterpoise.

I purchased six of the Nickel Metal Hydride at the Charlotte hamfest
in 1995 and have used them for about a year in my Yupiteru MVT-7100
handheld scanner (500 Hz to 1.2 Gigahertz). They have worked well in
it, but it's a receiver only. Sometimes batteries behave less well
in the high current drain circumstances of a transmitting HT.

Cross-posted to: alt.radio.scanner,alt.radio.scanner.uk,rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.scanner

Hi there,

Can anybody supply me a diagram-copy for the STANDARD AX700 scanner
50-904 Mhz. This is my own unit. The 2nd PLL goes out of lock
sometimes. Carefull tuning the trimcap (very touchy and sensitive)
on this module then restores lock again until the next time
(days-weeks up to months). In the out-of-lock condition a "
machine-gun " sound is heard (most probably caused by "hunting" of
the PLL control feedback) only when receiving a signal. It seems to be
quiet with no-signal even with the sql. control fully open. The
problem appears to be temperature related to some degree. There are a
lot of pots on the main pcb, so maybe it just needs a good alignment.
I will meet all costs; copy, postage ect.

Thanks Deon

I have an Icom W21AT for sale. This is a 2M/440 dual band hand held radio, and I also have a few accessories for sale with it. If you are interested in it, send me mail at rossspon@mindspring.com

Thanks,
Ross Sponholtz

>My little Alinco DJ-160T would not open the repeater, so I sold it to a more
>knowledgeable Ham. My question: Assuming my kit building skills are up to par, what
>quality of 2 Meter mobile would I end up with after building the Ramsey kit for $149.00
>plus about $22.00 for the enclosure?

I've built the Ramsey. It has some problems, some fixable, some inherent,
and output power is on the same order as a HT, so it wouldn't be my choice.
Ten-Tec has finally released their 2m transceiver kit, and first indications
are that it is better.

>Would I be better off just to buy the DR-150T alinco 2 Meter Mobile for $479.00?
>(Amateur Electronic Supply)

That's a lot of money for a 2m rig. Surely you can find better deals
out there. Look to the used market.

>I am looking at the IC-706 as a possible mobile rig. I was wondering if
>anyone who has/had one would recommend it, or any weakness it has.

See my recent post on this subject. I think the IC-706 is great,
but only 4.5 stars because it does have some faults (no rig is
perfect). Of course no other small radio even approaches 4 stars.
I'm amazed every time I turn the thing on that I get such good
performance out of such a tiny box, and I've had it for quite a
while, one of the first. I would caution that some of the faults
I consider minor, you might consider major. I'm primarily a digital
operator, with some mobile voice activity. If you're a CW op, you
might be less pleased with the radio. And don't expect too much out
of its VHF coverage. There's less there than meets the eye. (Though
figuring out how to improve it was fun.)

IMHO to get a better radio you'd have to spend thousands more, and
accept a much larger box. The ease with which you can tuck this thing
in a mobile is simply unbelieveable. It just disappears even in tiny
interiors.

About a year ago I rescued the items listed below from some lady's front yard where she was preparing them (with regrets) to be tossed. I gather that they belonged to a now-gone husband or son. Condition of the items is unknown, though I can say that I see no obvious defects except the amp is missing a tube. I haven't even powered them up and don't intend to. If you want one piece I wish you'd take all three, but please don't snag all three if you'll really only use one. Pickup near MIT, Cambridge:

- Knight KG686 RF generator
- Knight KG688 Sine/Square wave generator
- Heathkit W4B amplifier (audio?)

Regards,

Michael O'Donnell mod@std.com

Note: I posted essentially this same offer about a year ago, got quite a few eager replies and I was looking forward to the satisfaction which I assumed would come from giving the gear to a good home. However, I had so much trouble corresponding via email that I'm sure a number of people got pissed off wondering why I wouldn't communicate with them, and I *know* the whole mess just disgusted me - so much so that I finally got sick to death of bounced email and wrong addresses and just threw all the gear in my basement. So, please - don't contact me unless you know for sure that your message will have a *VALID* email address in it to which I can reply. Also, if the last time was any indication, you needn't bother replying if this message is more than a day or two old - just assume the stuff is gone. Thanks.

>COR detect off the link rcvr, etc.....and then it votes..

Yes, you're right, you can qualify voting with link COR or VOX,
but I think it has a drawback, the unsquelch time or VOX delay,
which limits the voter's ability to respond quickly to picket
fencing. Now I know that most systems don't like to switch that
fast, but I like it.

>NOONE uses the tone over voice mode anymore...SNR voters have gotten to
>the point in price where it isnt worth bothering with anything less
>anymore...

Well, I'll take mild exception to that too. As I pointed out in the
original article, there are problems with audio SNR voting, such as
an operator driving with the windows down, that can confuse the voter.
It may be a minor point for some, but I still think limiter current
in the remote receiver is the better measure of signal quality. And
tone over voice allows nearly instant detection and switching during
picket fencing.

Audio SNR voters have gotten very good, but I think there are still
some advantages to the older tone over voice method.

>Also you made a comment in your article that was slightly incorrect...

You're right of course. I was thinking of the repeater bandplan,
not the regulations.

>multiple function, multi-menu b.s. like the 706 ... I expect to keep
>my 900 a very long time ...

I guess that's why there's more than one radio manufacturer. I found the FT-900 panel to be large and busy, but not easier to read or use than the IC-706 control head. The multifunction multimenu system is a stroke of ergonomic genius in my opinion. It is very natural and easy to use after a very brief learning curve. Now if you want to see a frustrating user interface that wasn't well thought out, look at the FT-8500. I will concede that the crunchproof HF receiver performance of the FT-900 is better than the IC-706. I don't think it is enough better to overcome the other advantages the IC-706 has however.

Both are very good radios for the purposes for which they were designed. I wouldn't question anyone's judgement who chose the FT-900 over the IC-706, but for me the IC-706 won out, and for some of the same reasons that you found the FT-900 better, IE I like the user interface better, and I like the smaller control head. Having 6m and 2m in the box doesn't hurt either. And I think mobile antenna tuners belong back at the antenna, and not built into the rig. Most of that is subjective of course.

>behave 'on air'??

You're missing the best HF mobile on the market (IMHO) the Yaesu
FT900/AT ... while not as small as the others, it has a removable
faceplate (the TS50 doesn't) so you can mount the main radio in the
trunk ... and it has a built-in autotuner. My favorite feature is
that it has a "normal" interface ... one function buttons and knobs
.. no mickey-mouse multi-function buttons, knobs, and menus ...
important when I'm doin' 70 mph and 30 wpm CW (yes, CW only here) ...
its audio output is FAR superior to the others (important with wind
and road noise). It makes a great home rig, too. The receiver is
very sensitive (good!) and with the optional filters for SSB and CW,
it's selectivity is absolutely excellent ...

I had to make the same decision last year when I bought it, and
decided that 6 meters didn't excite me (and 10W on the Alinco just
won't cut it anyway) and that I'd prefer a nice 50 watt full-featured
2m FM mobile to the 10W all-mode in the Icom. You may have other
criteria, tho ...

There's also the TenTec Scout 555, which a local guy here SWEARS by,
but it didn't excite me ...

good luck with whatever ya do ... 73

I used o have one too; it was a rework for use on aircraft, and had enhanced shielding, and unusual knobs that could be felt by touch (round, square, triangular) so that radio ops blinded by the Bomb could continue to operate and make war.
Someone told me that it was used aboard the big Boeings that served as airborne command posts; mine came with a matching G-186 panadapter that shows signal s either side of the center freq. When I sold the radio I kept the panadapter because it worked with other radios. If you're interested first $375 takes the G-186.
I suspect that the low sensitivity (if not a part failure) might be due to impendance mismatching; they used small whips in active antenna circuits, and maybe these impedance matching devices had gain (probably tube type units too). Mine seemed pretty sensitive, but the lack of birdies and other spurious signals makes the band sound "dead" when actually it really is free from RF garbage. The better the adio, the more likely you're going to think "hey the band should be full of signals...where are they?" When actually a cheap radio has the band full of unreal signals...big difference.

3979. Re: YAESU FT-8500, FT-3000M

David,

I have an FT-8500...

David A. Kay (kham@halcyon.com) wrote:
: RE: The FT-8500 and the FT-3000M

: 1. How is intermod resistance?

So far, so good. In VHF + VHF mode, the "non-native" VHF side seems slightly more prone to "intermod". Not too bad, though. The manual warns of this. In V+U mode, no problems at all.

: 2. How easy/hard is the auto dial to use?

I assume you mean auto dial DTMF. It's easy to program and to use, but it's NOT easy to switch between autodial and no autodial on the fly and especially while driving; you have to go through the menus.

: 4. How much and what can you control the rig from the MH-39 , MH-36 mike?

I don't have the MH-39, but it looks well layed out. It does have one rotary knob that's multiplexed between VHF/UHF/volume/squelch. Once you get used to the FS-10 mic (the other one), lots of stuff can be easily controlled from the mic. The FS-10 is not for everyone, though.

: 5. Overall, how would you rate the rig?

The FT-8500 seems to have solid radio performance. If you like lots of features, it's great. It may be overkill for some people, though.

>experience to date.

This was a great comparison, but the Omni has one more thing going for
it that wasn't mentioned.

The 850 won't run QSK with an external amplifier because there's no
RCV antenna input. With the Omni, all you do is add an external
electronic T/R switch and you're all set. :)

I have an ICOM IC-707 HF transceiver. The rig works just fine
although it is probably one of the more basic HF rigs around.
I'm sure there must be a mod to increase the RX sensitivity on
the broadcast band. Below 160 meters the rig is somewhat deaf.
Doeas anyone have ANY mods or info on this rig? Anything would
be of interest. There seems to be very little around about this
particular rig ... perhaps it's a bit of an orphan??
Cheers de Andy VK2AAK.

Hello!
Have you found anything?
If yes - could you send me anote!
I have the info, but it's in my summer-cottage, 100 miles away! I would like to have it here!
It's nice to have the possibility to make the readio into a signal generator sometimes.
The tip i think about is the one where you by pushing som buttons simultaneously can get into an extra number of menu's!
73/regards boerge/Bob

3984. FT 1000MP more menu's!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-25 00:00:00 UTC

There are some "hidden" menu's on FT 1000MP:
A. Press & hold LOCK+FAST - while turning on power.
B. Press FAST+ENT simultaneously to go into manuf.-mode
C. Now you have some interesting things under menu 9-9.
Nice - eh?!
Info tnx to SM5DXB (not on the net)

Put simply, since the other fellows did a great job detailing the OMNI VI, it is the finest weak signal radio I have ever owned. And, that includes the FT 1000, FT 990, TS 940, IC 765 and 17 others! It is a pleasure to use and has the best ergonomics of any rig I have used. Further, it is a joy to use on CW. It is a hand's down winner. I will not part with mine.

I like it. Works well.

Only drawbacks are no direct (plug/jack) DC power input to the radio. I suggest buying the E-DC-12 DC adapter and the FBA-14 AA battery case (which regrettably don't work _together_). Covers all the local repeaters on both bands for me when used at base location with AR270 groundplane at 3 watts. I got the MH-12A2B remote mike, have gotten many good comments on audio.

The FNB-38 9.6 V battery (600 mAh) lasts a disappointingly small time when used to transmit, even at reduced power. I read all the stuff about NiCd batteries, do it all, and then regret buying expensive, heavy battery packs that give you a tiny amount of power. My preference is to buy bulk alkaline batteries (they are 2,400 mAh) at Sam's, and throw em away. At about $1.20 per set, that's at least 40 sets for the price of a NiCd, and they last many times longer for me.

I like the display and the keypad (backlit) and it is very small and solid. Has nice battery pack connection scheme inside the radio, spring loaded gold contact pins look very well made.

It does have a strange limitation in not being able to erase a memory once programmed, and it will dump all memories if you follow manual instructinos for enabling then disenabling wide range reception.

Still waffling over whether this rig is better than Kenwood TH79, but no major regrets.

cheers,

Jerry Cupples

Dave:

This sounds like a deadly combination. I think you will face the same distractions with this combination we already face when talking on the radio in the car, which I think most of us can handle just fine. The problem, though, is that like most other things on the motorcycle, everything is so much more critical and less forgiving (traction, skidding, riding over bumps, etc). If you or someone else in traffic *happens* to screw up, the difference between avoiding a problem and being hurt/killed might simply require that extra bit of attention you had been giving to the radio (even just listening to a QSO). I think it just comes down to a gamble. Again, the same problems are present elsewhere (operating CW and voice in the car, etc), but the stakes are higher. I tried riding my CB750 with an HT and an earphone for several days (receive only) just to listen to local police traffic, but I didn't feel comfortable with that, and I abandoned it only after a few days.

Anyway, good luck with whatever you decide -- just use your common sense in either case.

This winter has been too long. I'm looking forward to taking the bike out of storage this week!

The preamp usually does the trick, also then you do not need to modify
your radio by changing the mic amplifier feedback resistor for more
gain. E-Mail the nice guy at ICOM 's email address
75540.525@compuserve.com and ask for the heil mic preamp circuit.
ICOM has a little single ended amplifier circuit they send out as a
guide for heil mics, seems to work well.

>abide by their rules. It really has nothing to do with who does
>or does not have an ownership claim to the spectrum.

Hi Gary,

No, ownership is a *crucial* issue because it's the only basis by which government can morally justify such actions. When a person or organization owns property, it has the right to grant another person the privelage of using it and the right to remove trespassers and other violators by force. However, the government doesn't own the electromagnetic spectrum and that's what denies the legitimacy of the F.C.C.'s claim to its physical regulation and control. Regardless of laws passed by Congress or the number of guns they bring to bear in order to enforce them, F.C.C. control (and particularly sales) of spectrum will still be wrong.

The evidence of this is found in part in the difficulty the government has in differentiating its control of frequencies from accusations that it is abusing the right to free speech. If the F.C.C. were to convey legitimate title to spectrum, such confusion woudn't exist. It would be all too clear that one's right to free speech doesn't justify unauthorized use of frequencies any more than it permits one to steal a printing press.

This all goes back to events that took place right after the invention of radio (i.e. discovery of spectrum). At the time, it was reasonable to expect that government would deed frequencies to U.S. citizens, and many Congressmen understood the necessity of that approach. The transfer could (and should) have taken place in much the same way land was deeded in the 1800's, or at worst, by holding spectrum in public trust until an equitable method of distribution could be devised. However, the military stepped in and through the use of fear tactics convinced the majority of so-called representatives that its needs should be held superior to the rights of individual citizens.

Although few realized it at the time (or even now), this was a turning point in American politics. For the first time, government had expropriated an entire natural resource for its own purposes, with no intent of ever conveying title to individuals who had the right, by virtue of their citizenship, to own it. The true depth of this problem is apparent when it's realized that the F.C.C. is now

"selling" spectrum to private citizens at frequency auctions, but
still refusing to provide title.

>Governments can't grant rights, whether those rights are property
>rights or any other kind of rights. Rights are inherent. Government
>can only infringe rights, either via the exercise of force or threat
>of force.

Don't forget that government can also *protect* rights. In fact,
that's the only legitimate role of government in a free society.

>That's all government is, the most powerful set of goons in the
>neighborhood. Governments, like any other gang, wield power by
>operating a protection racket, with the protection offered being
>mainly from *them*.

Government needs sufficient power to protect the rights of private
citizens, in order to prevent anarchy. All other use of government
power (including the involuntary acquisition of that power) is
illegitimate and is aptly described by what you've said.

>the TM-251 have autodial capability.

> If you have any of these, how like them and evaluate them for
>intermod rejection and ease of use for DTMF dialing?

> TNX, de AB7FV, Dave

I just went the 9 yards on this as well and chose the 2500M. 1) the mil spec vibration/shock thing was important to me as this was going in my 4x4. The next important thing was intermod rejection, and 2500 is stiff. Driving around with a dual band antenna through intermod alley and not a chirp. Same results with a 5/8's tuned 2 m antenna.

I almost went for the 2200 also ruled out the 3000 at $500 why not buy a real dual band - 70 watts heck I don't even use 50 all that much.

I suggest that you make a table with the features you want on one axis, and the radios on the other, check off the features in each radio and the radio with the most checks wins.

I really like mine. It is very quiet which is a requirement for me. It is the quietest of any of 5 amplifiers I have owned. I don't run it with more than about 40 watts of drive = 800 to 1000 watts out. I am a conservative kind of guy. It will run about 1300 out with 100watts. It is forgiving of error. I make lots of mistakes, such as transmitting on the wrong band, etc.

4014. >>>>HELP - Small VHF Xmitter for Airborne Telemetry<<<<

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-26 00:00:00 UTC
From: BlueSky@tiac.net
Message-ID: <3158530A.156C@tiac.net>
Source record: 203863

Can someone help me by pointing me to a schematic or an article of a small VHF transmitter? It is
to be used to relay telemetry from a series of high altitude rockets. Following are the (desired)
specs:

Frequency: 2m band or nearby; XTAL controlled;
RF Power: 50-250 mW output;
Supply: 9-12 VDC (battery);
Modulation: N/A

Complexity (ie. size and weight) should be as low as possible, as should the cost - lets face it -
the typical life of these devices will be measured in minutes. I would preffer to build the xmitters myself as integral part of a telemetry package.

I have hundreds of various scanner crystals that fit in this category. They have fundamental
frequencies around 16MHz, but I don t really know if I can use them for this project.

I would very much appreciate any help in this matter. I can be also reached at

mailto:BlueSky@TIAC.net

My thanks to all those who reply!

4018. IC706: use of FL223 as primary SSB filter

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-26 00:00:00 UTC
From: dgf@netcom.com
Message-ID: <dgfDovux9.M8A@netcom.com>
Source record: 203867

Would it be possible to replace the main SSB IF filter in the IC706 with the optional FL223? If so, then it would make SSB "narrow" by default, but that would be fine for my mobile usage (where I don't care about sound fidelity), and would let me install a narrow CW filter in the remaining optional position. While I suspect one might have to slightly adjust the transmit SSB offset (it is a front panel option during SSB mode) I suspect it might work.

Has anyone tried this?

From: sba3020@InfoNET.st-johns.nf.ca
Message-ID: <4j9njs$8jc@coranto.ucs.mun.ca>
Source record: 203869

A few years ago EEB made an HF option for the Icom R-7000 called
the NOVEX - FC7100B. It let the R7000 cover from 20 Khz to 25 MHz.
The unit had a off/on/ttl switch, HF connector, V/UHF connector,
TTL connector and another connector with a RCA female jack.
Can someone tell me about this option, how to use it and
it's specifications. I called EEB about it and the said they
still sell it but don't have any information on it. Even
if someone had an owners, it manual would be just what I wanted.

Anyone else have this EEB option for the R7000?

4022. Re: TEN-TEC Omni VI

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-26 00:00:00 UTC
From: turner@safety.ics.uci.edu
Message-ID: <4j9mco$fu3@safety.ics.uci.edu>
Source record: 203871

I replaced an IRCI equipped Kenwood TS 940S/AT with an OMNI VI a few
months ago. I also was able to let go of my Drake twins soon after
the switch. (silly, I know, but I needed the money, and the OMNI was the
R4C equal in everything I could see except out of band rejection.)
I made some comparisons before the move. Here are some
of my basic feature comparisons:

Kenwood TS 940 * Ten Tec OMNI VI

1. Slope tuning wonderful * PBT very sharp, not as versatile as slope
for SSB

2. IRCI filters great, * Filter choices much better, quite as
nar SSB and CW (400 Hz pair) * sharp as IRCI, more of them, cheaper

3. Audio peak for CW great * No audio peak filter, digital lowpass fair

4. General coverage receive * ham band only, no big problem

5. built in AC only power supply * no built in supply, but runs on 12 vdc
good for many purposes

6. built in auto tuner * no tuner, but good final section,
I always use an external tuner anyway

7. good RF processor on SSB * audio processor, yuck

8. VBT on cw * PBT with narrow filters equal to VBT

9. 3 level attenuator * one level of attenuation

10. dual great noise blankers * one noise blanker, good

11. Very heavy unit * light, easy to move

12. stupid memory system * very good memory and menu system

13. manual notch * auto notch and manual notch, but
auto notch distorts SSB audio

14. filters dep on mode * filter choice indep of mode

15. * anx antenna switch (rcv) on front panel

16. * keyer built in, auto ID timer, better
fast VOX for SSB, bandstacking registers
and other more modern features included.

17. auto tuning rates for * static tuning rate, but set from front
band scanning from knob * panel. Can set very slow, for precise

CW tuning with narrow filters

****

Now, in general, the receivers were comparable under most circumstances. I am in an area where a local AM BCB station pushes the TS 940 meter to full scale even with the 30 db attenuator on. For 160 and 75 meters, without an antenna tuner in line, the front end of the 940 crumbles. The OMNI does maybe a bit better, but not a big difference. I always put a tuner in line to work 160 and 75. (I use a nonresonant 450 foot horizontal loop 40 feet up, it loves to pick up AM BCB. The only receiver that can handle it is my Drake R4C.)

The Kenwood 940 has more pleasant sounding receive audio on SSB with the pair of 2.7 KHz filters against the OMNI pair of 2.4's. The Ten Tec auto notch is useful, but I don't like its distortion.

In close in signal work, where big signals come up next to your weak ones, the OMNI seems to do a lot better than the 940. Not common circumstances, and not a huge difference as far as I can tell, but enough to notice. Makes working stations much more pleasant under heavy QRM. You can REALLY TELL during a 160 meter contest in the late evening, when the CW signals commonly come in with full scale 60 db over S9 ... and you want to hear a weak one next door. You kick in a 250 Hz filter behind a 500 Hz filter behind the standard 2.4 KHz filter and tweak the PBT. It is impressive.

BOTH rigs suffered from bad gain equalization with the CW filtering. Switching in the narrowest of CW filters in either rig with a weak signal can be tough since the filters have a lot of loss. Ten Tec has an extra IF amp you can use to make up for some of the loss, but it does not cover all cases, as I have found (especially the pair of 250 Hz filters). The Kenwood with IRCI 400 Hz filters suffers the same. Not a big deal to put in a little bit of extra gain yourself in either rig though.

Overall, I still respect and love the 940. I keep an IRCI equipped Kenwood TS 440S/AT because I love the thing so much. It keeps up in 99 per cent of all situations. However, the Ten Tec OMNI just puts me over the top in good selectivity / filtering options and the 12 vdc power source, which is important to me. There are other good things about it, but these were the critical factors to my choice.

: I like it. Works well.

: Only drawbacks are no direct (plug/jack) DC power input to the radio. I
: suggest buying the E-DC-12 DC adapter and the FBA-14 AA battery case
: (which regrettably don't work _together_). Covers all the local repeaters
: on both bands for me when used at base location with AR270 groundplane at
: 3 watts. I got the MH-12A2B remote mike, have gotten many good comments on
: audio.

: The FNB-38 9.6 V battery (600 mAh) lasts a disappointingly small time when
: used to transmit, even at reduced power. I read all the stuff about NiCd
: batteries, do it all, and then regret buying expensive, heavy battery
: packs that give you a tiny amount of power. My preference is to buy bulk
: alkaline batteries (they are 2,400 mAh) at Sam's, and throw em away. At
: about $1.20 per set, that's at least 40 sets for the price of a NiCd, and
: they last many times longer for me.

: I like the display and the keypad (backlit) and it is very small and
: solid. Has nice battery pack connection scheme inside the radio, spring
: loaded gold contact pins look very well made.

: It does have a strange limitation in not being able to erase a memory once
: programmed, and it will dump all memories if you follow manual
: instructinos for enabling then disenabling wide range reception.

: Still waffling over whether this rig is better than Kenwood TH79, but no
: major regrets.

: cheers,

Bob,

Are you SURE you want to use AM?! There are a number of really fine FM Stereo Transmitter kits, for not too much money... More good news, they are fully transistorized and without too much effort, you can use a car battery and stay on the air for a LONG time.

I think there may even be a Newsgroup for folks that use such devices? They discuss all types of 'boards' and modifications for greater range. A few talked about a amplifier that can be attached for watts of output power, however, such operations would be in clear violation of FCC rules and regulations. I sure would not recommend it.

The only things I can recall about such AM efforts is a AC operated AM transmitter I have... It was designed for 'drive-by' open houses, where a external tape recorder/loop would mention the highlights of the property... A sign outside reads something like: "Tune Your AM radio to 1500 for more information about the property". Frequency is adjusted with a knob. (Yours for $50). It is transistorized so you may be able to modify it for mobile use.

The second item was a AC, one or two tube (117P7 or ??) 'oscillator' that happend to work ok in the AM Band... 'Miller' made the special coil that was required. I recall seeing the coil in the Allied and Newark catalogs many moons ago.

Try the RC hobby suppliers/magazines, the battery distributors seem
to target the radio control guys more than hams. I've been getting
most of my cells from Tower Hobbies (Sanyo Cadnica cells -- they also
have NiMH cells (with and without solder tabs)), they seem to have
better prices than the ham suppliers do (not an ad, just a satisfied
customer).

regards,
Dean.

> "Aerodynamics are for people who can't build engines"
> -Enzo Ferrari-
>
> Jonathan M. Tallon jmtallon@mtu.edu M.T.U.
> KC8CVN - Amateur radioYou will get all sortw of advice. I recommend trying to hook up with a
used ICOM IC-735. If you can, get the Icom power supply with it and tryi
to find one with a 500 or 250 hz cw filter (I prefer the 250 hz, you will
need it later on). The IC-735 has been around for a long time and it is
hard to find because it is a fine rig.

As to the 2-mtr handheld, I am very happy with my Yaesu FT-470. It is a
dual-bander (144/450). You really should look for a daul bander -- they
don't cost that much more and you have a lot of flexibility.

Best advice I can give you is: Shop around; ask lots of questions; do
not buy the first thing that pops up. If you are not cmfortable with the
guy you are doing business with, don't buy from him. Take your time.

The lotto for spaces closed on Feb 5, 1996 and with the 'drawing' following shortly after (read couple weeks)
Yes, it's a full house, and those lucky to get picked should be seeing info in their mailbox, those not so lucky
will get back their checks. The Hamvention has a website:

http://users.aol.com/hamradioclub/dayton.html

You'll also find links from most amateur mgfrs and the ARRL websites.

NOW - THE IMPORTANT STUFF! I'LL BUY YOUR SPACE & TICKET!!!

GOT SPACES - FOUND OUT YOU CAN'T ATTEND? EMAIL ME!!! I'm looking for one, two, or three spaces and
Vendor Passes! No, I'm not brokering - I want for my own use. Having been going to Dayton since 1965, this is
only the second time I've had to scrounge for space! If you're brokering and looking to fund a new rig - save the
email.

Chuck Hawley's comments about the hassle to work within the rules is on target - as always - too many chiefs in
the DARA tribe and the poor little Indians are going eight ways at once. But, it is Dayton!

4037. Swan 600/ Heath Apache

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-26 00:00:00 UTC
From: Ken Harrison <ken@cs.sonoma.edu>
Message-ID: <Pine.SUN.3.90.960326145717.17998A-100000@zippy>
Source record: 203886

I have a friend who has the Swan 600 twins and a Heathkit Apache transmitter. He is wondering what a fair asking price for these would be. They seem to be in pretty clean condition externally. The Apache worked when it was stored and the 600 twins *might* need a little work on a selector switch.

He wants to sell locally but needs an idea of an asking price.

73,
Ken

4038. NMO GPS Antenna?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-26 00:00:00 UTC
From: kjsmith@violin.aix.calpoly.edu
Message-ID: <4jafqh$jcm@violin.aix.calpoly.edu>
Source record: 203887

I'm thinking about adding GPS to my vehicle (a good compliment to all of the ham gear :-), but I'm a little disappointed at the availability of external antennas. I got away from mag mounts long ago, and I'm not looking for some bulky clamp-on boat antenna either.

I know GPS is being used by more and more companies for AVL, so I'm figuring someone must make an NMO version of a GPS antenna. If not, then how about some kind of N-connector mount for the roof?

Any sources for these items would be appreciated. I checked out a couple of catalogs (Tessco, Larsen, etc) without success.

Thanks, Ted. I have done so and came up with the 3000. It has the
same 2 meter receiver as the 2500 so should be very "chirpless" plus I
need the autdial memories. Good choice on your part. My brother did the
same. And I just heard that the ICOM 2000 is not nearly as intermod free
as it is advertised to be. Thanks for you help!

Stay wih the DR-150T, I think you must be looking at the "Suggested
Retail Price". You should be able to get one for around $329.00 at AES,
HRO, and the many other's. Much better than a Ramsey. My experience
with Ramsey radio's has been less than satisfactory.

> You really need to answer several other questions, how harsh an environment for one. How cold and how hot? For many repeater's you can get certain add on devices that will help in severe climate. Most of the repeater's made are pretty good and will do what you want with few exceptions, I would be more concened with the duplexer's in extreme climates, expansion and contraction of the metal used can really cause trouble. Coax or hardline? What frequency 2 meter's, 440 and so on.

Anyway, I been where you are now with respect to starting a repeater. I've now built 7 repeater's and learned that usually the actual machine is the least of the problems.

To which I would like to add that there are many of us in this newsgroup who do not live in the United States, and to whom the First Amendment is irrelevant. I am, however, aware of the significance of the First Amendment, and would like to say this: The First Amendment is a right, and one which you are justified in seeking to protect. But with rights also come responsibilities. It seems to me that too many of you demand the first without being willing to accept the second. The posting of obscenities in this newsgroup is IMHO an irresponsible act which shows the person responsible up in a very poor light indeed. It is also an insult to the vast majority of decent people who live in the US and who do *not* abuse the First Amendment. Furthermore, every time you post an obscene word, racist comment or whatever, you are handing ammunition to those who want to see the Net more tightly regulated. Ultimately, your actions could bring about curbs on the very freedom you are claiming to uphold. Think about it!

--- END OF SERMON ---

Please, no E-mail or flames on this. It is off topic, but I believe it needed saying. Now let's get back to talking about shortwave radio.

4053. Re: If you don't like it!...(Was: @!#$, my FM-25 is @#&%$! What to do?)

I clearly understand both the issue and the law, which is precisely my point, Dan. There really IS no issue and there certainly IS no law (at least, not yet). It saddens me to know that my kids can no longer read this Group without me first reviewing it. But it's MY responsibility to manage what they read, not yours, the author's, some service provider's, and certainly not society's or our government's. How about let's trying to keep it that way, Dan.

What other plans do you have that can further erode the freedoms guaranteed to us by the First Amendment of the U.S. Constitution. I'm sure we're all anxious to hear them.

That's exactly what the First Amendment protects, Einstein. It allows us the Freedom to abuse it, respect it, think its irrelevant, hate it, love it, etc.

Obviously, your views toward the irrelevance of The First Amendment, and probably the U.S. Constitution, allow you to make such ignorant statements.

Hear, hear! What a great attitude this fellow has! I, too, have loaned gear to beginners and handicapped hams to help get them started.

I agree that there were a lot of rude, insulting responses to this poor guy's request. It really does hurt to ask, I suppose. A lot of folks have a hard time when they are first starting out. That's no reason they can't try to have a hobby as well. And he wasn't asking for a FT-1000 or TS-950SDX, just some kind of rig. I'll bet he'd have been thrilled with an HW-101, Tempo One, or some other old but workable rig, just to get on the air. That's the way I was back in my impoverished college days. I had a borrowed HW-101 that I was very pleased with.

Cut the guy some slack!

Hey Dan, or Steve, or whatever your name is,

Is this what they teach you up in the woods of Washington State, just a bit north of Prarie Ridge, a little east of Bonney Lake and Puyallup? Did you visit the Michigan Militia for your email tactical training?

Hey everybody, if you really want to hide out, away from the reality of living in the United States of America in 1996, away from drugs, crime, profane language, and newsgroup abuse, then visit Dan and his buddies out in the middle of nowhere, Washington. Just think, you guys could maybe even write your own Constitution. By the way, is Pat Buchanan a member of your little Draconian hermit club?

Don't suggest that people wage cyber war on others, Dan, unless you've got as much spare time on your hands as we do.

From: Mel Dixon <MELD@mimi.itg.ti.com>
Message-ID: <315866A3.684@mimi.itg.ti.com>
Source record: 203933

I left a message yesterday requesting some help on increasing the power out on the FT-990 and recieved two answers. The gentleman suggesting a look at the reflected power, thanks, I did and its ok. The other gentleman, Paul P., I could not get back to you as your e-mail address seems bad. I tried pbp@gate.ti.com with no luck.

I am trying to increase the output of the 990 by about 10 to 15 watts. The factory setting is low by that amount and the Henry 2KD linear is asking for more grid current. The normal grid current should be between 225 and 250 mA. I am driving to about 185 mA. Thouhgt if there was a output adjust on the 990 I would turn it up a bit.

>| .

The two methods that are most often used today use a status tone to determine which receiver is squelched and when that tone drops, the voting process begins via a s/n ratio process. In the case of the Motorola Spectra-TAC system, the comparator looks at the amount of noise in the band region just above the voice spectrum. The voltage generated from that measurement creates the criteria from which voting occurs. The GE system works pretty much the same way.

The Spectra-TAC in particular needs to have full time rf links, microwave circuit or a telephone line to connect the remote receiver to the comparator. The GE system does not. I have seen several installations

where the remote site was selected by the presense of a carrier from a link receiver. In this instance, the remote receiver was really a base station and the remote transmitter was slaved with the best signal quality from the remote receiver. This was NOT a repeater, but was a half duplex base system with several remote sites, all on the same frequency.

The voting process was handled by, I believe, E and M inputs on the back of the controller. I would have to look in the manual to be sure because I never did it that way.

On the other hand, the Motorola TAC system uses another method for determining signal quality. In the newer version of the system, the remote receiver uses three 6709 squelch chips that are set to 10, 20 and 30 db quieting respectively. The encoder card in the receiver is silent when squelched. When unsquelched it starts sending the lower tone with 10 db quieting. If the signal strength increases to 20 db, both tones are sent and if the signal is dfq at 30 db quieting or more, the high tone is sent. This has nothing to do with limiter current, it is really just three squelch controls which can be a real bitch to set up correctly, but when set, they generally stay set.

The comparator looks for each tone or the combination of the tones and makes its voting selection based upon the collection of tones from each receiver that it is presented with. The nice thing about this is no status tone is used. Therefore, rf links do not have to be up all the time. This may well end up being the prefered system for amateur use as it puts the signal quality measuring process at the receiver and the quality of the link does not come into play.

This does not, however, forgive the sloppy amateur practice of using unmatched equipment and different link receivers just because that is what was laying around or could be dredged up for free. Such practices cause the repeater to have a different sound depending upon the receiver selected or when a transmission is in progress the voter selects a different receiver and the signal that was about correct in audio level starts blasting because someone never bothered to set up the levels correctly.

Bob I have had the 870 for 3 months now. I find it excellent. I am able to pick out signals I was unable to with my other rig (FT890 Yaesu) Un fortunatly it is in the shop now with a bad optical encoder. When I try to slowly tune in a station the frequency will stop incrementing. I am wondering if anyone out there has had this problem or any other problems showing up?

A suggestion on the FT-51R and battery life. Buy your batteries from after
narket suppliers. I have the 7.2v/1500ma and 4.8v/1500ma packs from W&W.
Either last me two days of listening and occassional low power Tx'ing. These
are better than Yaesu batteries because they are vasstly less expensive and
easily equal in performance.

Also, try turning off many of the bells and whistles. Beep on an active
channel, lamp on an active channel, etc. I found them to be rather a lot
of fluff, and they chew up battery life. I bought my radio in late 12/94
or early 1/95, don't quite recall. Been very pleased and impressed with it.
Now beta testing EZ-CLONE software for programming. Fun radio to play
with.

Don't know anything about the Kenwood, never seen one

You know, a year+ is an awful long time for amateur radio makers to have
the same model HT's as their lead toy. This radio should be discontinued
soon, forcing down the price of existing stocks. Or so the trend seems
to have been the last several years.

4080. IC-706/AT-180 mobile operation problems

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-26 00:00:00 UTC
From: Rastislav Slosiar <r.slosiar@trl.telstra.com.au>
Message-ID: <31579687.41C67EA6@trl.telstra.com.au>
Source record: 203949

Anyone tried to setup an IC-706 with the associated AT-180 into his car?

I get the following syndrome, especially on the 20m band. I use
a reasonably well tuned helical antena.

By pressing the TUNE button for more than 2 seconds, the tuner
starts tuning and quickly matches my helical antenna. The SWR
reading is then below 1.5. However, when I start talking, the
tuner light starts flashing (although the SWR reading is still
below 1.5) indicating it is trying to match the antenna again and
eventually goes out. I have to press again on the
TUNE button to get the tuner into operation. And then the same cycle
starts over. I am trying to do a QSO when engine off and in front of a
house ("stationary mobile operation"). Then I did the following
experiment: I removed
the antenna and connected a dummy load instead. While the TUNE
light is ON, I started transmitting into the load. The light
starts flashing for a while and then becomes steady, meaning that
the tuner was able to match the dummy load (great!). This is how the
tuner should operate when the antenna is connected.

Any hints from hams having experience with their HF transmitters
installed in a car? Does this have something to do with grounding?
I am currently using the helical on a magnet foot on the roof of the
car while stationary, and I am planning to set it up on a tow bar at
the rear of the car.

Any hints/suggestions are welcome.

4083. Chgo Area Classes Nov/Tek/Gen/Adv/Xtra

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-26 00:00:00 UTC
From: dreambig@ix.netcom.com
Message-ID: <4j7tg2$hcu@ixnews3.ix.netcom.com>
Source record: 203952

So the printer said ....
"What's the big deal --
It's only one letter off!"

They are nice cards - just the wrong callsign.
So I asked myself "What can I do with all these
QSL cards that are 'almost' right?"
And then it came to me -- turn lemons
into lemonade and send them out anyway
to introduce myself and my
"one-day license seminars" to other hams.

My idea is simply this --
ham radio classes see a lot of drop-outs
because the classes go on too darn long!
People have better things to do with their lives
than attend 6 to 12 weeks of ham radio classes.
I am looking for students and
sponsors for one-day license workshops.
If you know anyone interested in getting their
Novice ticket or upgrading to Technician,
General, Advanced or Extra, please
have them call me. I will teach a one-day
theory seminar & workshop for any
license level -- Novice through Extra.
I've taught ham radio to about 300 people
during the past 10 years from Novice
through Extra and always enjoy the excitement
in the faces in front of me.

What do I need to make this happen?
I am looking for a club that wants to sponsor
the workshops. The sponsoring club will:
1) provide a suitable room for an all-day seminar
and
2) get students lined up for the classes.

What will the club get in return for their effort?
Classes are a great source of new members.
Classes can also be an income producer
if the club wants to charge for them.
Keep the money as a donation to the club
or let that money pay for a one-year club
membership for the new ham.
My services are free to the club and the students.

Please call me if....
* Your club or repeater group is
interested in sponsoring a workshop
* You or someone you know is interested
in a one-day Upgrade Workshop
* You know someone interested in a
one-day Novice Workshop

A WHOLE DAY!! I'm not sure people would be willing to take that much time
out of their busy lives to become a ham!!

4086. Cabling question

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-26 00:00:00 UTC
From: Mark Pettigrew <m.w.pettigrew@shu.ac.uk>
Message-ID: <31585D1A.1CB0@shu.ac.uk>
Source record: 203955

I have just replaced the 30-odd metres of cheapo RG58U connecting my HF rig to my aerial with UR67, and measurements I made indicate a fair saving on power loss in the cable.

Two questions spring to mind:

(1) Would there be any benefit in terms of EMC to sheathing the cable run in copper pipe, suitably earthed? In an ideal case, I know that the inner surface of the screen in coax is half of a pair with the centre conductor, and no current should flow on the outside of the coax screen. However, about 10m of the coax runs underneath one limb of the dipole, so presumably there is at least a small induced RF in the outside of the coax screen because of that. So would a copper pipe as an extra 'screen' (I use the word inadvisedly, I am sure!) do any good, or would coupling between it and the coax cause more problems than it solves?

(2) I soldered the screens of the UR67 to the PL259 connectors using a fine gas torch and ordinary electrical solder. I just heated the connector around the hole until solder flowed into the hole, presumably contacting the screen of the coax. Does this damage the plastics in the UR67? (I smelt no smells!) And is the benefit of having a soldered metal-metal-metal connection rather than a metal-oxide-dirt-oxide-metal connection greater than any problem caused by heating?

I have a 738 and obtained the mod from ICOM. You will have to send them a copy
of your MARS license, though, before they will send it to you.
Also, the tuner works in the MARS frequencies I need since they are barely outside
the ham bands (e.g. 4020 USB).

has anybody got any comments on the T-Kits 1209 2M -> 6M
transverter kit?

I'm looking at this kit for my next project.

I've built the Ramsey 2M PA, and several other kits, without
too many problems, so I've got a bit of kit building
experience.

How difficult is this kit? how good is the quality?
Are there other kits that are better that do the same
thing (2M->6M)?

Is 5W output enough to get started on 6M (I can add a PA
later -- maybe as next year's project :)).

regards,
Dean.

If you plan on using it for a lot of 2 metre mobile or even base for that
matter you will want to preprogram all your repeater freqs into memory.
Not someting you would want to try while moving.

Also no DTMF for autopatch. Other than that it's a pretty good rig.

Hello all.

I got my hands on a GE Master II UHF rig with remote console, interface, cable, external speaker, and mic...basically complete.

I am wanting to put it on 9600 baud packet, and am trying to gather any and all information about it. IE; watts, amp draw, pin out of console and mic, where to get crystals, value, and just ANY other info you may would be appreciated. A schematic for this rig would probably bring tears to my eyes. :)

Thanks much, & take care.

My wife and I are pretty fond of our ICOM handhelds for marine use. The M-10 uses the new package and 'AA' cells, which makes it very nice. $199 in the discount shops, about $230 elsewhere. You can spend more, but there are few extra features you would need in a handheld, unless you want the DSC or scrambler (the M-10 does support the scrambler option, I believe).

You might post in rec.boats for a lot of specific opinions.

From: "Bruce C. Raisley A.R.S. N9ZLE" <n9zle@concentric.net>
Message-ID: <315A0306.3F81@concentric.net>
Source record: 203764

I have the Kenwood TM733A, The radio works fine for all I need.

But I have thought about putting up a reapeater. By using TWO TM733s
I can configure a repeater for both the 440 band and 2 meters by using
the rigs in cunjunction with each other.Both haveing a remote/recieve
site. this will give a user on either band access to both. Enough said.

My problem is putting together an identifier for the system, I can
create the identifier, BUT the 733A will not allow itself to be keyed
when in crossband repeate mode, by mike or data conector.

Q. Is there any way of defeating this problem?

4095. Re: Ten-Tec 1209 transverter kit: comments?

Newsgroup: rec.radio.amateur.equipment

From: "B.C. 'Jay' Jackson, Jr." <jackson@mail.us.net>
Message-ID: <81757.jackson@mail.us.net>
Source record: 203765

I have just started building the TenTec 6 meter to 2 meter transverter. I have over 25 years experience building Heathkits, Knightkits, Eico, Ramsey etc. (Last year I built a Heathkit HK-232 TNC that I bought at their "going out of business sale" and had saved all these years. It was easy by comparison.) I can tell you this about the TenTec kit. Quality is good. Instruction manual is excellent in that it is very complete; however, if you are going to build this you'd better know what the heck you are doing. It shouldn't be your first electronic kit. They don't draw individual pictures of the parts like Heath did. You have to know or be able to figure out what all parts are by their names, including a few unusual ones. You have to wind RF transformers. You have to have access to some test equipment. You supply your own solder! In short, I am loving it. I enjoy building things like this, and I have all of the necessary tools, test equipment, etc. to do it right.

I will post when I get it done and let you know how it works.

BTW, I have already a TenTec 6 meter to 20 meter transverter, which I bought from a friend who built it and wrote an excellent review of it for a local club newsletter. It works but seems somewhat noisy on receive to me. I bought the new kit for the fun of building it, because I have a couple of 2 meter multi-mode rigs that have power controls and a few 2 meter HT's, because I can't cut down the power on my HF rig very well, because the new transvertor covers the whole 6 meter band, not just the lower 2 MHz. One negative on the new kit is that it doesn't have the bypass switch and extra M connector on the back like the 20 meter version does.

4097. FT-1000MP

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-27 00:00:00 UTC
From: Bob <w5tkb@airmail.net>
Message-ID: <315A19FE.179B@airmail.net>
Source record: 203767

For those who own FT-1000MP's, I have discovered that there is a mistake in the instruction book regarding the cw contest keyer function as described. Contact with Yaesu confirms the error and omission in the book. The contest exchange number function will not work as described. In order to use this capability, one must load contest exchange in memory associated with key/switch #1 rather than #2. Load into #1 your contest exchange followed by either 3 or 4 question marks depending upon your choice in function 7-6 for contest starting number. e.g 599 ???? switch #3 will increment contact number and #4 will decrement as described. You can use #2 as another memory -- just as described in book for #1. Yaesu will soon introduce the FTT-1000 key pad to use for these functions but in the interim you can build the switch setup described in the book. This is how I discovered the problem which was then confirmed by Yaesu. Apparently, they have no intention of informing buyers or supplying errata sheets unless they inquire.

Rastislav Slosiar <r.slosiar@trl.telstra.com.au> writes:
> Subject: IC-706/AT-180 mobile operation problems
>
> Anyone tried to setup an IC-706 with the associated AT-180 into his car?

Well, I tried the AT-180 but not in my car. (For mobile operation it is
better to adjust the antenna itself rather than using a tuner. To get
the relatively short antenna radiating, it should be resonating).
I use the IC-706 currently as a base station in combination with the
AT-180, connected to a G5RV antenna (short dipole) with a current balun.

> By pressing the TUNE button for more than 2 seconds, the tuner
> starts tuning and quickly matches my helical antenna. The SWR
> reading is then below 1.5. However, when I start talking, the
> tuner light starts flashing (although the SWR reading is still
> below 1.5) indicating it is trying to match the antenna again and
> eventually goes out. I have to press again on the

EXACTLY THE SAME HERE! I have this problem on most bands. I did some
experiments, here are the results:

1) The phenomenon only occurs when using some kind of amplitude
modulation. If you X-mit with FM, no problem occurs. If you use either
AM or SSB, the tuner goes crazy.

2) I created two special dummyloads to test the tuner. One was 100 ohms,
and the other one was 25 ohms. This should be far within the tunable
range of the tuner. (According to the specs it matches 16.7 to 150).
The tuner did a fine job on matching 100 ohms, however, if I connect
the 25 ohm dummyload, the tuner initially tunes perfectly, but when I
start to modulate the 706 with AM or SSB, the light starts flashing,
and the tuner disables itself after a while, confronting the 706 with
a sudden mismatch.

> Any hints from hams having experience with their HF transmitters
> installed in a car? Does this have something to do with grounding?

It has nothing to do with your car. In my house it shows the same
erratic behavior. It has also nothing to do with grounding. A G5RV
is a symmetrical antenna, so actually it even doesn't need grounding.
I tried all sorts of grounds, but nothing helps. And remember, it
even fails on a 25 ohm dummyload. (If you want to do the same experiment
you can use two 50 ohm dummyloads in parallel to create a temporary
25 ohm dummyload). Your antenna probably has a low impedance on 20 meters.

I'm going to send the AT-180 back, unless I get a reasonable explanation
from Icom why the tuner behaves this way, or if they send me a fix.

The tuner *could be great* but it is useless at it is right now.

I would appreciate it very much if other AT-180 owners let me know their experience with this Icom 706 specific tuner.

Hi Richard!

The Question - & the replies are gone!! HI
It can be done - a good, stable, clean signal generator is expensive.
If one can find/or make an attenuator I think you can make your rig into
a rather good s.g.
Of course you dont't connect a s.g. to an antenna - HI.
But - where can one find a good attenuator, with 10 dB steps over a
range of 100 dB - I am looking on all flea-markets for an old
"slaughterable" generator!
73's from Stockholm, where we are hoping for spring - temp right now up
& down around freezing, but the days are getting longer - in the coming
week-end we are switching to "DST

CQ CQ

I am looking for a vhf/uhf handy that covers - for the emergency case - the VHF maritime band, abt 156MHz, with as much HF pwr as possible - the (monoband) IC-T22 offers 100% HF up to 155MHz, tx up to 174MHz.

Connecting to abt 12 to 16 V DC shouldn't be a problem, automatic charging would be nice. As I have another rx for wx on board, am rx is not important to me.

It would be better still if there were such a beast that one could modify for 9k6 packet, but that's not the most important thing.

Oh, last but not least, price is a matter, too: It doesn't have to be the latest, smallest, nicest (whatever that is) or has to come with DTMF or CTCSS (it's for use in Europe).

FOR SALE: A classic 1970s Heathkit HF station!

SB-102 HF CW/SSB transceiver
100% tube type, with pair of 6146s in the PA. 100 W
PEP output power on 80/40/20/15/10m. Original Heath
400 Hz CW filter installed. No un-documented mods.
SB-640 Remote LMO with interconnecting cable.
SB-600 Speaker with interconnecting cable.
HP-23 Power Supply with interconnecting cable.
Copies of all operating manuals.

Operating condition:
Fresh alignment, all tubes good, no known problems.

Cosmetic condition:
Front panels, lettering, VFO dials, etc, look good. The
aluminum knob skirts show minor wear. SB-102 and SB-640
cabinets have been re-painted an attractive light green,
a bit brighter than the original. SB-600 and HP-23 have
not been repainted and don't need it. Inside, all four
pieces are in good shape, not all full of crud, lint, and
smoke residue like many old tube-type rigs get.

ASKING price for the package is $300 cash (negotiable).
Buyer pays ACTUAL shipping costs. E-mail or phone me
if you're seriously interested. 73 and Thanks!

Right on Joe, a cavity load makes a good test for load stability!. It's
the loss of "loading" and phase shift over a narrow frequency range that
makes the amp oscillate with a cavity load, not incoming signals.

> Good Luck!, Dave

Hi
I have a TM-241, It does have the "display problem" In cold weather
the display will some times show all the segments or just some of them
or none at all. As I operate mostly on one repeter its worth noting that
the radio works just fine even when the display is acting up as I don't
need to change frequency etc. I beleve the problem to be mechanical not
electrical as most times a good wack on the radio brings it back. I
will some day get into the radio and see if I can find the problem, but
interments are hard to find as they go away when you look at them.

>
>------------------------------

The TS-870S did not seem to have the nice features of the Yaesu radio. Just looking at its schematics, it appears that it has the same Mars/Cap alteration as did the 850 and 450. The only difference is that there is no diodes to cut but only resistors. I did not find any others menus besides the calibration menu (N.R.+SSB on power on). There is another menu ?? (N.R.+CW on power on) just shows the word READY and 3 possibles positions but no further indication, besides an error code for the DSP. ANY Suggestions ???

<r.slosiar@trl.telstra.com.au> wrote:
> Anyone tried to setup an IC-706 with the associated AT-180 into his car?

Rasti-

I'm running that combination with good results. I have observed the
problem you mentioned on a couple of occasions.

In one case, I was trying to use a Hustler 40 Meter resonator on 10
Meters. I had been successful with that combination using the TS-50 and
AT-50, but the Icom was barely able to match it. Then, the light would
blink while transmitting, indicating that it wasn't a perfect match.

In another case, I tried a 160 Meter antenna on the same mount, which
happens to be a magnet-mount. When using an MFJ-249 SWR meter, the
antenna appeared to be a perfect match. When trying to match it, it
appeared to match after trying for a while. However, the light would
blink while transmitting, and sometimes go off.

I have come to the conclusion that something in the antenna system is not
linear! At low power levels when the tuner is tuning, one condition
exists. At higher levels when transmitting, another condition exists, and
is probably the result of an arc through the paint on the roof of the
car. In other words, I don't have a good ground at 1.8 MHz.

In your case, you may only have a marginal match. On the other hand, it
is always a possibility there is an arc condition or loose connection
causing your problem.

I have also observed that the AT-180 doesn't match as wide a range of SWR
as the Kenwood AT-50. I understand that there is a minor mod or switch
adjustment in the AT-180, that will reduce its sensitivity to reflected
power. I haven't tried it yet, but it might be all you need to resolve
your problem.

The first amendment of the Constitution of the United States gives individuals they right to sat whatever they want without fear of criminal prosecution from the government. It in no way protects individuals from being criticized by other individuals for what they say or how they express themselves. The poster of the original article stepped out of the bounds of accepted "netequitte" and was properly criticized for it. Learn something about the Consitution before you appeal to it to excuse your lack of manners.

4117. Help! Swan 500C problems

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-27 00:00:00 UTC
From: draagen@news.connectnet.com
Message-ID: <4jbqke$38i@news.connectnet.com>
Source record: 203827

I recently acquired a Swan 500C transceiver. The price was right and I'm willing to work on it, but I've discovered a problem that perhaps someone reading this news group can help me with...

I've been using it as a receiver for a few weeks now, trying to improve my CW copying skills to the point where I could engage in a QSO (I'm a Tech +, and copy rather slowly, so far). I finally thought I was there, so I carefully read the tuning procedure in the Swan manual and attempted to follow it to the letter, intending to call CQ.

I ran into a problem right away. After following the Receiver tuning procedure, I started the Tranmitter tuning procedure and in the first step, where one keys the transmitter, then rotates the Carrier Balance control for minimum cathode current, discovered that I didn't have _any_ cathode current at all. Also, there was no power output indicated on my power meter.

I've checked as best I can with an old analog multimeter, and it would seem that all the voltages are present. I've swapped the P.A. drive tube with the audio frequency output amp tube (they're both 6GK6), and the transmitter mixer tube with the receiver mixer tube (they're both 12BE6), with no change in symptoms. I _don't_ have an oscilloscope, or I'd trace the signal path.

Any assistance would be welcome; I expect that I've got a marginal tube or two, as well, but once basic functionality is restored, I'll pursue that issue.

Carlos Ramirez (carlosr@csulb.edu) wrote:
: Just for a curiosity which of the three is the best. First, consider overall
: performance and second, the best value .

They all have their problems. TS870 uses DSP for all main
filtering, but after too much gain/AGC, so suffers bad close-in overload
before the signal reaches the digits. Sounds and works fabulously on less
than demanding conditions. 775 has possibility of fitting narrow option
filters to fix this problem, but then you get the standard analogue
filter performance of one of the very best radios, the 765, with what is
equivalent to a DSP *audio* filter behind it. FT1000MP is similar to 775.

It may take some time before analogue to digital converters get
improved to the point where they can equal the best of the all-analogue
radios, then DSP will have really arrived. You can do wonders processing
signals digitally only AFTER you've converted them to digital form.
Things are changing so rapidly, whichever you buy will be obsolescent, fast.

For that money, I'd insist on a radio with an upgrade path!

cheers
David GM4ZNX

4120. Re: What is a TS-711A?

Hi Bruce, I own a TS-711A and use it as my base station radio. Modes are A3J (SSB), F2, F3 (FM), A1 (CW). No AM like my old TS-700. Power in is 120V/240/220Vac and 12 to 16Vdc. Power out is continously variable from 2 Watts to 25 Watts.It is 15 lbs in weight. Dimensions W279 x H108 x D327mm. Double Superhet design 30.265 Mhz 1st IF, 10.695 2nd IF for SSB/CW and 455 kHz - FM. Has DCS Digital Code Squelch, Dual 10 Hz digital VFO, 40 channel memory, the offset and subtone (PL) can be memorized, has Auto mode select, Scan, RIT, IF Shift, Speech Processor, RF Attenuator. And a real D'arsonval meter -- no LEDS.

Not sure of mfg dates I think I saw new ones in catalogs about 1990 or so. Prices I have seen lately are from $600 to $750.

Options were VS1 Voice Synth and TU-5 Sub Audible Tone Encoder.Has ACC 1 and ACC2 rear connectors for com devices i.e., RTTY and computer interface it sez. I use a TR-7800 for Packet not the TS-711A.

Hope this helps.Nice Rig for contesting on 2M and base station. Accomodates my use of San Diego Repeaters very nicely as well as a some SSB freq I use.

-->
-->1. Both of these rigs are Mil Spec

I've wondered about this. Knowing how demanding mil (883-B for example) specs are, I doubt that any of the Yeasu radios are "mil-spec".

Mil spec requires specially screened semiconductos (plastic pkgs are not allowed) etc. How can Yeasu claim mil-spec on cheapo (relatively speaking dollar wise compared to mil-spec) radios?

4128. Results: Best Rig for SWL and Ham

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-27 00:00:00 UTC
From: cdorn@gpu.srv.ualberta.ca
Message-ID: <4jc015$tc8@pulp.ucs.ualberta.ca>
Source record: 203838

Hi,
Thought I would post the feedback on the question regarding opinions on rigs that perform well for SWL and Hamming. Concerns for SWL were primarily focused around appropriate filtering for AM and RX audio quality. The votes so far went to:
Kenwood TS870S - 3 Votes - Reasons: DSP and superior adjustable filtering contributing to excellent selectivity and audio quality.
Ten Tec Paragon - 2 Votes - Apparently the shape factor on the standard 6KHz filter is quite good. Otherwise, not much more info shared.
Kenwood TS940S - 1 Vote - Excellent RX audio quality, and dependable performance.
Yaesu FT900 -1 Vote - Good filtering and audio.
Japan Radio Company - 1 Vote - Enjoyable to listen to, although the 6KHz filter's shape factor is a bit broad.
I really appreciate all the comments and feedback. It looks like the Kenwood product addresses some of the SWL concerns in the area of filtering. I would be interested to hear some more about the Ten Tec Paragon II. I know that the Omni 6 is a highly regarded rig, and wonder if anyone out there uses a Paragon (I or II), and what their impressions are. Once again thanks for the input.
Chris VE6RDC

What type of ground are you referring to? It's almost impossible to achieve a good RF ground with ground rods. Even if you bury a couple of junk cars and weld them together (I know someone who did that), the length of the ground wire creates a series impedance that varies with frequency.

I'm thinking about ARRL insurance. Any experience with it (claims)?
I don't have too much stuff -- just a few FM radios for voice and
computer networking. But, I lost a handheld last year while hiking!
An Alinco DJ-580T! I'll certainly tether my HT nicely while hiking
from now on, but a friend said that ARRL insurance covers accidently
like that, so I'm interested.

Message-ID: <Doxxwp.GCK@twisto.eng.hou.compaq.com>
Source record: 203848

Monty here in Houston. My nephew in Dallas (age 10) wants to get his license and I thought an HF communications receiver might allow him to listen to enough HF to find out if he is interested in getting licenses beyond tech, and if so, to copy some real CW conversations as part of his practice.

I understand that these days there are many capable receivers under $100 and that some of them can be found at superstores or department store chains.

My requirements are: Must be able to receive CW, SSB, and AM, must have external antenna connection, and must have fine enough tuning to separate ham conversations.

Any recommendations?

Source record: 203854

Bob,

You've infered too much from the term "mil-spec". There are *MANY* different "mil-specs", and the Yaesu rigs DO meet Military Standard 810C Specifications MIL-STD-810C Vibration and MIL-STD-810C Shock. Whether or not they meet the spec you reference, they DO meet the specs quoted by the sales literature.

I own several of their rigs that are "mil-spec", and in my experience they are built better than their non "mil-spec" brethern from any manufacturer including Yaesu.

Ditto. I pick up an Alinco DR-110 used for $200 Canadian (about 150
American). It needed some TLC, but if you're brave enough to build the
ramsey, you can easily do the repairs to "most" 2 meter radios. I've built
the Ramsey ftr-146 (the first generation 2 meter kit), and it was fine as a
packet radio, but that's about it.

I run the same mike on an Icom and have the same problems. Running the gain high is no problem. That is what it is for to adjust the gain to allow for different mikes and different operating habits.

Part of Hiels success is lower gain requiring you to be closer to the mike. It cuts out background noise. If you add a preamp you will likely get background noise. Just run the gain high, mine is all the way up, and keep the mike close to your lips.

Good luck

> de Brian N9ROVHey Brian,
I am assumming you are talking about a powered antenna as in
up-down retractable. If so a company named Stico will modify any powered
antenna to be a dual purpose Am-Fm and Vhf or Uhf antenna which is
functional and still goes up and down. They can be located at
716-662-2680. They usually require you to remove your existing antenna
and send it to them. They modify it and return it to you.. You will need
a splitter to connect the Am-Fm and the Vhf radios to the same coax. Ask
them about it.. good luck. Art WB6VKR

Jonty,
I have a Kenwood TH78, TH79. For most of these ham radio tranceivers, the divide by N-synthesizer, refence oscilattor scheme will produce low level spurious emisions back in the front end. These signal are called (birdies), slang for fundesired frequency mix products that somestime get detected. The Lo to Rf leagage of these spurs radiate out of the synthesized LO chain leak thru the mixer,(worst in single balanced mixers) and fall into the passband IF with certain combinations of desired of RF and LO offset frequencies.
Each radio, wheather it be a TH28, Th79, W31, FT51R all have these symptoms, some worse than others. The Ft51R will have them on different frequencies than the W31, etc . Most Radio Ham manufactures, hopefully did a frequency plan in their design, but as you use the radio outside the ham band, you will discover all of the ham rigs has spur(birdies).
Using the radio on 143Mhz is usually considered out of band, and the manufacturer can not guarantee the spur spec level in the radio. Also these radiated spurs are also dependent on VSWR. The stock antenna may have a good VSR in the ham band, but a spur at 1/2 of 143Mhz may be leaking out the front end and its harmonics with a divide by N reference may can a mix and that product may be seen at 143.xxx frequency.
You really can do too much, except get another radio like a Icom or Yaesu, if its a sythezied type ham rig. Normally a commerical radio in that range would be a better choice, like a Motorola Radio.
One thing you can try is a different antenna on the hand held. You might try the ANLI types 144/450 which have a balun (black base at bottom) whip built in the base. With the Balun type, the out of band spur leaks out, get asorbed by the balun, rather than reflected back into the front-end. This may get the undesired reflected LO to Rf leakage spur to drop and additional 10 -15db. Allowing the spur be be very low and hopefully below the noise fllor of the radio.
The ANLI whip I remember was the combination 144/450 with an screw in extendable telescoping whip as well as the flexible whip,it has a low vswr from 100-500Mhz, thus if a lO spur leaked our it would relect back in to mixer at a lower level, hopefully one that is below the detection level of the RF to IF noise floor of the radio.
I would try out other brands, find one that doesn't have the birdie on the frequency you want to operate at. Buy that brand, and sell off that radio to another ham who would be happy to take it off your hands.
The only other solution is to fiddle with different antenna's. If you put a 50ohm load on it and the spur disapears,then maybe playing with different antenna's would decrease the spur out of the radio, If you still hear it while a 50ohm resistive load is on the radio, then I would bet you may never get rid of the spur(birdie).
I hope this helps you out.

4155. Chgo Area Ham Radio Classes -- Novice thru Extra

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-27 00:00:00 UTC
From: dreambig@ix.netcom.com
Message-ID: <4ja0hg$jev@reader2.ix.netcom.com>
Source record: 203898

My idea is simply this --
ham radio classes see a lot of drop-outs
because the classes go on too darn long!
People have better things to do with their lives
than attend 6 to 12 weeks of ham radio classes.
I am looking for students and
sponsors for one-day license workshops.
If you know anyone interested in getting their
Novice ticket or upgrading to Technician,
General, Advanced or Extra, please
have them call me. I will teach a one-day
theory seminar & workshop for any
license level -- Novice through Extra.
I've taught ham radio to about 300 people
during the past 10 years from Novice
through Extra and always enjoy the excitement
in the faces in front of me.

What do I need to make this happen?
I am looking for a club that wants to sponsor
the workshops. The sponsoring club will:
1) provide a suitable room for an all-day seminar
and
2) get students lined up for the classes.

What will the club get in return for their effort?
Classes are a great source of new members.
Classes can also be an income producer
if the club wants to charge for them.
Keep the money as a donation to the club
or let that money pay for a one-year club
membership for the new ham.
My services are free to the club and the students.

Please call me if....
* Your club or repeater group is
interested in sponsoring a workshop
* You or someone you know is interested
in a one-day Upgrade Workshop
* You know someone interested in a
one-day Novice Workshop

>Marty, Spokane, WA

Hi Marty, I have the DSP59+ and really enjoy using it. I don't do much
digital but it does a good job. It is very good on CW and helps quite
a bit on SSB also. I tried the MFJ 784B before buying this one and the
Timewave is much easier to use. I would buy it again!

The cavities are a highly inductive load and my not present a solid 50 ohm load to the amplifier. The circulator or isolator
presents a constant load to the tx.

Hi Dean,
While I have not built the TT kit I did hear a # of them on 6M last Es season- they were consistantly the nicest sounding sigs on the air. Previous postings here indicate the instructions hark back to the excellent days of Heath. Note also they now have a 2M to 6M downconverter to place your 2M all-mode on 6. I've been told the 1st run is sold out! I have no affiliation w/ TT in fact I don't own a TT!- but if I had serious interests in HF I would own nothing but TT.

I need to learn and need equipment

Want to talk globally and do local S&R and talk with the man that
saved my life in Alaska(he has only ham for communications).

I will joining a club in my local area when if? I get mobile

There are many repeaters in my area I believe(Seattle area)

I would like to spend 500$ or less for working equipment?

If you have some or can help please let me know.I am starting to study
code and already no some from being a commercial fisherman in AK.
Also I understand I am entitled to some sort of doctors waiver to get
the license.

thank you a bunch!! D.Davy Earl

Even as I thought the original post was poorly thought out, I felt this response was even more disturbing.

So here is my counter response.

In article <4jes57$ek6@newsbf02.news.aol.com>, n9mxt1@aol.com (N9MXT1) writes:
|> Hmmm reading your message was very interesting. I personally feel you
|> wrote the message for 1 of 2 reasons.
|>
|> 1) Maybe you thought the Newsgroups were becoming quiet and thought that
|> writing a message against HF would stir-up some activity!
|> 2) Maybe you have nothing else to write about!?!? and thought to yourself
|> hmmm who can I put down today??

Translation:

I can't argue against your point effectively, so I'm going to use a common tactic that discredits your position. This is to state without any attempt of proof that the only reasons that you could possibly have for stating your opinions are some illogical and immature ones. This then gives me the upper hand since I have belittled anything you might have as a point in one fell swoop.

|>
|> OK... well, theirs many aspects to the hobby and some people like HF and
|> others I
|> guess don't!

Translation:

Here is my statement that shows how open minded I am, I will use it for counter arguements later. This is regardless of statements made below.

|> Personally, I find pleasure working DX and working
|> contests.. I have accomplished many awards for my working stations on HF.
|> ie: DXCC / WAS / WAZ and more.

Translation:

I'm a big bad-assed operator that has vast experience, so don't mess with me sonny-boy.

|> When, I get on HF I have normal
|> communications with fellow hams and also have my short exchanges too. I
|> know people personally who hate HF only cause they are to lazy to upgrade
|> to have the HF privilege added to their license. So, you have a right to
|> hate HF but,

Translation:

I have just called you lazy in a not-so-thinly veiled manner. Since I can only conceive that the only reason that someone wouldn't like to do CW is that they are beneath me and therefore lazy. I can't just get it that someone may have looked at the situation and made an intelligent observation that is contrary to mine.

|> if your justing going out and bashing the HFers like myself
|> you should at least write another message after upgrading from NO-CODE to
|> a higher class!

Translation:

Since you have only the lowly-scum, barely worth anything license you can't possbily know anything. I've been around these here parts for a long time you whipper-snapper, so don't try to tell me how it is.

|> "Just an idea!". Basically, the ending to your message
|> saying "I've worked my share of HF, I thus I have not upgraded" only tells
|> people that you did this via CB radio or your willing to operate illegal
|> on bands you don't have rights too.

Translation:

I seem to have forgotten that someone without a license, or a "lower" class license may operate a station at the priveleges of the control operator of that station. I'll also throw in the showstopper, equating you with CB. I know it is equivalent in terms of credibility to just calling you a name, but hey, it works.

|> So, why should anyone care what you
|> think!!!!

Translation:

Shut up! You are nothing, you can have no opinions or observations since they don't agree with mine.

|> If you don't like the laws that the FCC made in this country
|> then maybe move to another country where you don't have these rules to
|> follow.

Translation:

Yeah, what do you think this is? A democracy or something? Our founding fathers fought against the status-quoe and tyranny so I can tell you to shut up and take it or leave it.

|> Well, I don't want to put you down or anything but you seem to have a
|> lot of problems on your mind so maybe you should get some help!

Translation:

Here is my other attempt at trying to look genuinely open-minded, at least in the first part of the sentence. The rest is of course my feeble last stab at

discrediting anything you might say by name calling and insinuation. Because, of course, if you disagree with me then you must be crazy.

|>
|> Have fun complaining... HFer's BEWARE of people
|> like this!!
|> Jeffrey - N9MXT1

Have fun taunting and ridiculing... Everyone BEWARE of people like this!!

>
>Hi all.
>I have a bad Nicad pack from an FT-530. If I remember correctly, tha last
>time I tried to dissassemble a Yaesu pack from a 470, it was extremely
>difficult.
>Does anyone have any tips?
>I was thinking of using a heat gun to soften the glue...
>
Most likely, there is no "glue" per se, it is "welded" together with
a solvent which softens the plastic and allows the two parts to merge
together. Then the solvent evaporates and the plastic re-hardens. So
using a heat gun would cause serious melting of the plastic case before
any weakening of the joint would occur, since the joint and the rest of
the case are made from the same material.

Usually the welded part is quite a bit weaker than the virgin plastic,
so tapping or pounding on the seam with not quite enough force to break
the case may work. Once one side opens up, some prying may be indicated.
If it doesn't want to crack at all, take a razor blade or jeweler's saw
and cut along the seam; plan on using lots of glue to put it back
together. Since the "welding" process is theoretically supposed to make
the two pieces into one, making it back into two cleanly is difficult.

My experience is with Standard packs, not Yaesu ones, so I may be
completely off base here. For example, make sure there are no screws
hidden under the labels, etc. before you assume it is indeed held
together with glue.

4172. Re: HF!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-28 00:00:00 UTC
From: Monty Wilson <mwilson@bangate.compaq.com>
Message-ID: <Dp00Es.9L4@twisto.eng.hou.compaq.com>
Source record: 203716

herb@alpha1.csd.uwm.edu (Nathan Ryan Gingras) wrote:
>...Why would anyone want to be on HF? The conversations
>are always empty & meaningless....

I have had conversations on HF regarding the following subjects:

Model airplane flying
What kind of traffic can be heard on railroad frequencies
'60s Mustangs
What life is like in the jungles of Honduras
Antenna design
The effects of low line voltage on radio power supplies and stability
Birdwatching
Telescopes
Bicycling
Automatic sprinkler systems
and many more.

Of course there are always those folks that want to exchange signal reports and sign off; that is their way. They like to hear and give signal reports. There are many hams on the air doing things I can't imagine being enjoyable to me. But it's a big hobby and there is no accounting for taste.

I hardly ever call CQ. If the band's not open, calling on it will get you nowhere, and if it is open, there's usually an interesting conversation going on that you can hear, you just have to tune around and find it. If two people are discussing something of interest to me and one of them has to sign off, I wait until they're finished and call the remaining station.

Why are your conversations always empty and meaningless when others are having real fun ragchewing on HF?

>...The only in depth conversations I have ever had on HF were with people
>within 20 miles. You could use 2 meter, or 440 for that, and spend less
>on gear!

Yes but it's the people, not the distance, that make the conversation more interesting. For example, if I hear you and a friend 15 miles from your house discussing Alfred Hitchcock movies on 40m ground wave, and you have to sign off, then I could give him a call and see what he thinks about "Suspicion" being colorized. THAT is something I could not do if you had been talking on 2m or 440.

>What is the point of yelling CQ CQ CQ (or ponding CQ CQ CQ) just
>to get a stupid qsl card?

Why do you mention cards; if you're not interested in collecting them,
don't ask for them.

>...The only good HF is QRP, because at least you are accomplishing something
>somewhat outstanding.

Says who? There's no accounting for taste. Sure, I got an extra thrill
with my CB conversions knowing I could work countries on 10m and 12m with
just a few watts output, but by far the biggest enjoyment were the people
with whom I was talking.

> Buying a $2000 rig accomplishes nothing, but
>wasting money.

For me, yes it would be a waste of money. But it might not be if I was
going for DXCC or something which could be accomplished more easily with
all the bells and whistles. My HF radio cost me $700, the one before that
was about $500 and my first rig cost $135.

> Anyone can work across the contry on a big 100w rig with a
>huge antenna.

Sure, but if you hate HF why bother?

>HF offers little enjoyment to people who are more than 'postcard
>chasers'.

Well I guess I'm less than a postcard chaser because it sure gives me
a real kick.

>Nate's suggestion for improving HF:
>
>
>1) Instead of code, require a test in socialization & conversational skills.

Have you started studying yet?

>2) Allow no more than 50w 40m and below.

Why these magic numbers? If fifty watts is enough on forty meters, then
why not on thirty meters also?

>3) Make it illegal to talk about root canals (noone cares!)...

If no one cares about a subject then making it illegal would be a waste
of effort. A conversation about a subject presupposes that there are
at least two people who care about it.

: using the kepyad to dial directly, if needed. Are you saying that you
: have to go into menus to to reset settings to do this?

I replied to Dave directly, but for anyone else who's interested:
Yes, you have to go through the menus (a minimum of 6 or so key presses
if you remember the menu code for autodial) to turn on or off autodial.
You can't send individual DTMF tones if autodial is on. This brings
up the idea of being able to directly access autodial when in non-autodial
mode by, say, hitting the ENT key before hitting the number key. Too
bad they didn't do something like this...

Stephen,
Take a look at the "N0XIC's Amateur Radio Resource Page." It
should be easy to find with a search engine. He has a link to packet
radio and I am sure if you follow enough links you will come across a
site that has just about every wiring interface listed. I have seen it;
then didn't record the site.

Good luck 73 Jack KB7NO

Hey I agree, you should listen to 75meters, them bozos belong on the
chicken band, I take that back sorry CBers.

I have about 2 grand tied up in my HF rig and don't use it much at
all. Mostly because the good bands are open durring the day
WHEN I'M AT WORK!, To many YOYOs like those at 3898 and 3950.
None of them are here because they can't read, got the license
by the grandfather claus I think.

For those who want to look me up!
I'm N9ZLE (GENERAL CLASS) I'll be Advanced in a few months.

CW is where its at! RTTY is good too.

Message-ID: <kauffman-2803962151530001@dialup71.gnatnet.net>
Source record: 203721

Hi

I was woundering if anyone out there can tell me about the Maxon SP-2000 series handheld VHF radios. I've come across three units and a charger - no batteries though. The lititure that came with the radio is sparce.

My questions are:

1. Are these radios rock bound or synthesised?

2. If synthesised, what kind of unit is needed to program the radio?

3. Is there a supplier (other than Maxon) of batteries for these units?

Thank you in advance.

I am having trouble locating a distributor that carrys "currently
in production" air variable caps. I have found surplus sources
that have components that will work but these are limited to the
stock that they have. Usually less than 20 or 30 pieces. Fair Radio
thought that there was at least one U.S. manufacturer of air variables
still kicking. If anyone could point me to manufacturer or distributor
it would be greatly appreciated. Thanks in advance.

From: louis@postoffice.ptd.net
Message-ID: <4jcts3$ste@ns2.ptd.net>
Source record: 203725

I acquired some military shelters that I had planed a use for, but I did not ever see the project through. I
am selling these shelters and thought you might like to check out a few photos of them. If you click on the thumb
nail you can see the larger picture in 800 x 600 resolution. The shelters are rated to block Rf frequencies
up to, I believe, 1.3GHz and at 120db of attenuation. These would make Ideal radio repair rooms. The construction of
the units are double aluminum clad over a foam core with an outer kevlar skin (Bullet resistant!). In pictures 8 and 9 you
will notice that the shelter can be used with a 40 foot Wil-Burt pneumatic 9 section mast. I am selling these masts separately
if desired. If you would like the shelter with out the mast I can reduce the price some what. These masts are like the
ones on the news vans, except that these are built to Mil Spec and the original cost to the defense contractor was $20,000 each.
Don't worry that is not my asking price.

I will sell you the mast separately for $2,500
I am asking $5,000 for a shelter with a mast, and I am asking $3,500 for a Shelter with out the mast.
If anyone would like more details, I can be reached at (717) 629-7212 ask for Louis or E-mail louis@postoffice.ptd.net

To see photos of these shelters use your web brouser and go to this URL

One of the things I used to like about ham radio was the careful use of language that allowed hams to discuss the same things the other radio services were discussing, but with a touch of class. The topics were the same, the the choice of words permitted discussion on "family" channels and in "mixed company" without offending most listeners. Not so for the choice of words in the original post, and follow-ups in this thread.

From: radiomatt@aol.com
Message-ID: <4jdcgn$1f0@newsbf02.news.aol.com>
Source record: 203774
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

I had the insurance from time to time; three or four years, then off for a couple, and then back on again. Last winter a water pipe froze and burst inundating my radios. The tube stuff stood up fairly well, but my prize pair of HRO-500 and matching HRO-600 got pretty much destroyed. The 500 is still fixable, so I did not ask for replacement (or $), but the 600 is REAL rare; I had it appraised; they said it was a total loss, and the Wohlers Company made good for $2500.
(The pair, in one cabinet, had been insured at $3100, out of total insured ham shack of about $11K).
No complaints here. They handled the claim professionally and rapidly once the appraisal came in --that took 4 mos, but not their problem.
Go for it

I agree with Gary; if it drives the rig and doesn't create a problem,
don't worry about it.

I'm curious about your description of this being a crystal element.
Heil rates these as having an output impedance of 2000 ohms. How is
that accomplished? Do these have an internal step-down transformer?

I second (third) the recommendation. I have seen enough RF coming down
a repeater antenna feedline to light a 25 watt light bulb. This can
cause a LOT of grief - not just in mixes, but also in repair costs...

Jimmy,

You will need the following:

1. Computer to BIB Box Cable

25 pin 30-80369B71 $62.00
or
9 pin 30-80369B72 $52.00

2. RIB Box RLN-4008 $200.00

3. RIB Box P.S. 01-80357A57 $24.25

4. HT-1000 Cable RKN-4035D $210.00

5. HT-1000 Software RVN-4098E $350.00

6. Software License RPX-4719B N/C

You will have to get #6 filed before you will be allowed to purchase
#5. Call 1-800-422-4210 (Motorola's Americas Parts Division) for
details.

If you have only a few radios to program, you might consider finding
someone who has this equipment and work out a deal with them instead
of incurring the rather sizeable expense yourself...

4198. Want info: Cubic Corp 1201 HF Tcvr

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-28 00:00:00 UTC
From: david@comms.ee.man.ac.uk
Message-ID: <4je1kk$i80@yama.mcc.ac.uk>
Source record: 203786
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Hi,

Several years ago now I bought (cheaply) a HF transceiver which
was badged "AEL 1201". The company AEL claimed to have no knowledge
of such a radio. Recently I learned that the 1201 was actually
only distributed by AEL and then only for a short period. It seems
the radio was built by Cubic Corporation (I think). I would be
very grateful if anyone could supply me with contact details for
Cubic, or better still, let me know where I can get information
(just the schematic would be great) on this radio. It has a
TTL based synth giving 12 channels and I would like enough info
to be able to homebrew a replacement synth/VFO.

Many thanks,

David

4199. FT-51R HACKING PROJECT UPDATE

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-28 00:00:00 UTC
From: davidm@hous.inmet.com
Message-ID: <DozC78.M3M.0.-s@inmet.camb.inmet.com>
Source record: 203787

All:

In my quest to find out more information on the FT51R radio
regarding computer interfacing I approached three parties
the have access to the information, but declined to share it.
They were Yaesu, RT Systems (makers of Yaesu's software) and
the makers of EZ Clone. RT told me they signed a Non-disclosure
with Yaesu and the EZ Clone offered the following excuse
as shown below from a recent letter I received from them.
I'm upset that Yaesu will not disclose information to owners
of the radio especially since everyone owning one has paid
so much for it. If this bothers you then call them at this
number: 310-404-2700 I was told that Kevin karamanos is
the Sales Manager and this topic needs to be discussed with
him - his extension is 223.

Anyhow this is what the makers of EZ Clone sent to me:

---------- start of quote --------------------

Hi David, I've been following that thread too. I understand your
frustration about not having 51R software for your particular system.
That's the reason why EZ Clone tries to work on more than one
system (currently DOS, Windows 95, Windows NT, OS/2, Unix (Solaris &
Linux)). BTW, almost everyone here at work is also a ham.

So far we've put a lot of money, time, and effort into this
project, and we just can't give out the information we've
worked so hard to acquire. So, I hope you understand, and
I wish you the best.

regards,
dave sims

--
dave sims
sims@acsys.com
kc5jkn
http://www.acsys.com - EZ Clone, software for programming amatur radios

--------- end of quote ----------------------

Well I can understand the EZ Clone point of view as well, but
what the three don't realize is that someone either me or others
working on the same thing will eventually crack the secret
and share it with everyone else. With that said I have work to
do - as I said before anyone that wishes to help or has information

please let me know.

>Gary,

>In what way does this mod. make the amateur bands less usable?
>How hard can it be anyway?
No the it really doe snot affect the amateur bands. You need to
remove a shiled box that also has a board connected inside, there are
20 solder connections here, then you remove 2 SMD devices. Now you
lift the main board, get the hobby knife and cut a trace, locate a
chip and attach a jumper wire from one pin of the chip to the cut
portion of the trace. better have a service manual handy for location
of the parts and traces. All of this for 10 watts and still you can
not do more than 4 MHz offset so the CAP users are left out if their
repeater spans the 2 meter band for inoput and out put. Marine
telephone and Duplex channels are 4.6 Mhz offset so it will not be
much good there either. I would say for VHF you are better having
something like a 281 or 2000 or some 2 meter only radio that does what
you require easily.

My TT 1220 2m FM rig is not working. Transmitter problems.
Probing with O'scope tells me signals are getting amplified
by all stages, but apparently start out way too low. Getting
only a few milliwatts output, about 8v pk-pk at collector of
PA transistor. Could someone open theirs up and make a few
scope readings through the transmitter chain so I will have
an idea what it should be doing? Manual does not say.

4203. IC-706/AT-180 mobile operation problems

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-28 00:00:00 UTC
From: aust@gandalf.sp.TRw.COM
Message-ID: <9603281457.AA11679@noldor>
Source record: 203791

Mine does the same thing, even though the VSWR is less than 1.5:1,
I believe the real problem is this my friends.
The IC-706 RF output VSWR detector samples the refelected RF off the
output as everyone knows.
Detectors are sensitive to load. As one modulates the transmitter, this
source impedance from the power amplifier varies along different contours
of the dynamic load line of the MOSFET PA.
At varying output levels, like SSB, AM , (not FM, CW) , this source impedance
varies. THe Antenna tunner stops at a 1.2:1 VSWR which is fine at a predetermined power
level.
When one modulates the SSB signal the VSWR interaction between the changing
source impedance(transmitter output level) and Load(Antenna) causes the VSWR
dynamicly to rise above 1:5:1. Thus the AT180 kicks out.
To prevent this from happening, a power reflected directional coupler with
better directivity is needed to prevent this. I believe Icom has no simple
answer.
The next way to calm the detector is to place a small chip attenuator(3-4dB)
before the detector. Detector diode impedances change as a function of drive.
This causes the pretuned minimum voltage to fluctuate as in the case of a
varying SSB, or AM signal.
I did this with my AT180 and IC706, readajusted the VSWR's theshold, now no
problem.
I am an electronic enginner designing hand held transceivers and we use
power detectors in ALC loops for power settings all the time.
I can't figure out why Icom Engineers missed on this one!!
73
Mike

>
> Anyone tried to setup an IC-706 with the associated AT-180 into his car?

Well, I tried the AT-180 but not in my car. (For mobile operation it is
better to adjust the antenna itself rather than using a tuner. To get
the relatively short antenna radiating, it should be resonating).
I use the IC-706 currently as a base station in combination with the
AT-180, connected to a G5RV antenna (short dipole) with a current balun.

> By pressing the TUNE button for more than 2 seconds, the tuner
> starts tuning and quickly matches my helical antenna. The SWR
> reading is then below 1.5. However, when I start talking, the

EXACTLY THE SAME HERE! I have this problem on most bands. I did some experiments, here are the results:

Hello Dean,

I received my 1209 2m - 6m transverter kit last week, but have
not started assembling it yet. The kit looks good as does the instruc-
tion manual. Lots of small parts! It has an attractive case and appears
to be complete.
Yes, 5 watts (8 watts actually) is plenty of power to operate
on six meters. Not to worry. As you say, you can add an outboard amp
later if you feel you need it.
All I can say is that I am impressed with the kit and am look-
ing forward to getting it on the air.

>my eyes. :)

Give us the combo number for the rig and we'll be able to tell you exactly what you have. The Mastr II is an excellent radio, and manuals are commonly available at larger hamfests. Hi-Manuals will also sell you a photocopy, and you might even still be able to get a new one from GE/Ericsson.

The flies in the ointment for using these rigs for 9600 baud packet are twofold. First, the radio uses phase modulation, which won't do for 9600 baud. You have to insert the modulation through the Channel Guard port, and modify the Icom for more deviation. If you do this cleverly, with an opamp, you can also sum in the temperature compensation voltage and retain commercial stability in the bargain. Be sure to strap the reactance modulator to a stable voltage, or it will introduce phase jitter in the signal from random noise fluctuations.

The second problem is a little harder to fix right. The receiver IF filter is too narrow, and there will be considerable phase distortion of the eye. I don't know where to get wider drop-in filters. There is a kludge that works if you aren't in a high signal area, however. That's to just bypass the IF filter with a gimmick capacitor. Better is to fit a wider filter, though you are going to have to adapt it, use a bit of perf board. Murata makes suitable filters. (Note, if you're using these radios for links, you *can* just lower the deviation until the eye straightens up and set it there rather than reworking the filters. The SNR margin is degraded slightly, but BER will be better due to the lack of phase distortion.)

The demodulator used by these radios also makes netting a little tricky. You do *not* adjust for channel center by adjusting for zero volts from the demodulator. The demodulator rests at about 2.5 volts. GE gives a different procedure in the manual for netting

these receivers. You should follow that unless you're very experienced
with these radios.

Source record: 203795

I have Kenwood's TM742A dual-band (expandable to tri-band) radio and am considering purchase of the 10m band module (UT-28S). Though I hesitate to ask, does anyone know if the extended receive, which covers 11m, would permit AM CB receive just as 2m permits AM Aircraft receive?

I know it is considered sport on these groups to run down CBers (err... figuratively speaking), but let's face it, there are more folks on the road with 11m rigs than 2m. When I hit a traffic jam and I want to know it's cause and workaround, ~27 MHz is a lot more likely to yield information than 146.52 MHz.

Don't bother telling me to buy a CB or perhaps kill a CBer for his radio and thereby improve the world while gaining a receiver :-o
I just want to know if the module supports AM.

Thx,
Paul
KB2TCG

P.S. 50W of AM Xmit might be nice too! <g>

Yaesu company memo
Date: March 5, 1996
To: Yaesu USA Amatuer Radio Marketing Division
17210 Edwards Road
Cerritos, CA
From: Technical Division Yaesu Musen Company
C.P.O. Box 1500
Tokyo Japan
Subject: Marketing Specs. and Features of the FT-50r

The following is a highlight of the list of features for the
FT-50r dual band handheld which should be used in all press
releases

Ultra compact unit--approximate size of FT-11R
MIL-STD 810 rating for extreme durability
Receive from 110-174, 320-475 mhz, 800-960 mhz
Transmit (American version) 144-148 mhz, 430-450 mhz,
and on the 800 mhz band, 7W high power @9.6 volts
ALL NEW: Cellular phone capability--unit is compatible
with the existing cellular trunking systems and
can be programmed by any cellular service provider
to function as a cellular phone
Digital track tuning for excellent intermod rejection in
severe operating conditions
Simultaneous dual band receive in any combination
Digital voice recorder/voice messaging system with CW ID.
Paging/Digital code squelch with digital voice capability
Spectrascan--bar graph display of frequency activity

Alaphanumeric display with 400 memory channels/30 autodial
memories
Ultra loud audio
Super-glo lighted display with backlit keybad
Dual Ultra high speed scan (30 channels/sec) with user
defined resume options
Splash resistant high impact case with non-scratch display
12 VDC direct input jack
Program the HT using WINDOWS and the ADMS-1B software
package
Built in 9600 baud packet ready port

ARTS--Auto range transpond system to visually and audibly
alert when another radio with ARTS is out of range
User friendly menu driven programming
Cross banding capability with CW id at desired intervals
Built in clock with alarm and QSO timer
Full line of accessories

4212. HF sucks!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-28 00:00:00 UTC
From: herb@alpha1.csd.uwm.edu
Message-ID: <4jelum$6ls@uwm.edu>
Source record: 203800

Hey, all those no-code HAMS who complain about not getting on HF are not missing anything! Why would anyone want to be on HF? The conversations are always empty & meaningless, containing only the following standard info:

1) The Weather
2) Type of Radio
3) Signal strength

The only in depth conversations I have ever had on HF were with people within 20 miles. You could use 2 meter, or 440 for that, and spend less on gear! What is the point of yelling CQ CQ CQ (or ponding CQ CQ CQ) just to get a stupid qsl card?
As far as the three items listed above,

#1, weather = You can watch TV for that.

#2, radio gear = Who cares?

#3, Signal Strength = Who Cares?

The only good HF is QRP, because at least you are accomplishing something somewhat outstanding. Buying a $2000 rig accomplishes nothing, but wasting money. Anyone can work across the contry on a big 100w rig with a huge antenna.

HF offers little enjoyment to people who are more than 'postcard chasers'. Even CB'ers, whom HF'ers seem to think are inferior, carry on more interesting conversations.

Nate's suggestion for improving HF:

1) Instead of code, require a test in socialization & conversational skills.

2) Allow no more than 50w 40m and below.

3) Make it illegal to talk about root canals (noone cares!)

4) Require a physical & hygene exam! (I get sick every time I go to a HamFest!)

Just my thoughts. No-coders, you really aren't missing much, so if you can't learn code for whatever reason, don't sweat it! You can get better looking postcards at the corner drugstore, and you can have better conversations with local trees, and other vegitation.

Nate.

Oh, yeah, you HF'ers are all going to look up my callsign, and to save you the trouble, it's KB9LSX, and I am NO-CODE. But believe me, I've

worked my share of HF, and thus I have not upgraded.

Hmmm reading your message was very interesting. I personally feel you wrote the message for 1 of 2 reasons.

1) Maybe you thought the Newsgroups were becoming quiet and thought that writing a message against HF would stir-up some activity!
2) Maybe you have nothing else to write about!?!? and thought to yourself hmmm who can I put down today??

OK... well, theirs many aspects to the hobby and some people like HF and others I
guess don't! Personally, I find pleasure working DX and working contests.. I have accomplished many awards for my working stations on HF. ie: DXCC / WAS / WAZ and more. When, I get on HF I have normal communications with fellow hams and also have my short exchanges too. I know people personally who hate HF only cause they are to lazy to upgrade to have the HF privilege added to their license. So, you have a right to hate HF but, if your justing going out and bashing the HFers like myself you should at least write another message after upgrading from NO-CODE to a higher class! "Just an idea!". Basically, the ending to your message saying "I've worked my share of HF, I thus I have not upgraded" only tells people that you did this via CB radio or your willing to operate illegal on bands you don't have rights too. So, why should anyone care what you think!!!! If you don't like the laws that the FCC made in this country then maybe move to another country where you don't have these rules to follow.
Well, I don't want to put you down or anything but you seem to have a lot of problems on your mind so maybe you should get some help!

Have fun complaining... HFer's BEWARE of people
like this!!

4218. AEA's Doctor DX Cartridge: Anyway to run on a PC?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-28 00:00:00 UTC
From: becker@areaplg2.corp.mot.com
Message-ID: <1996Mar28.185143.16376@schbbs.mot.com>
Source record: 203806

I have pretty much retired all my C-64 stuff, but I used to really enjoy using the Doctor DX cartridge. I'm wondering if there is anyway to run this on a PC?

I know there are programs to emulate the C-64 on a PC, but how would you interface with a C-64 cartridge? Has anyone hacked the code in this cartridge and converted it to a file that can be run from disk? Better still would be an out-and-out conversion to code that would run on a PC without an emulator.

John

4219. Yaesu HT Nicad dissasembly

Newsgroup: rec.radio.amateur.equipment

Hi all.
I have a bad Nicad pack from an FT-530. If I remember correctly, tha last time I tried to dissassemble a Yaesu pack from a 470, it was extremely difficult.
Does anyone have any tips?
I was thinking of using a heat gun to soften the glue...

Thanks,

Steve

Greg -
I bought and installed one about 2 months ago, and am pleased
with its performance. It replaced an ICOM 28H which is now in
the shack. The only thing I find bothersome about the RS rig is
my On-Off switch is a little sensitive. It's easy to double hit
and end up with the radio still off - but that's my problem.
Otherwise, it has lots of neat features and the scan feature is
very fast, much faster than the old ICOM. The one feature I
miss, is a quick way to listen to the repeater's input to see if
the sig is strong enough to go to simplex. There may a way, but
I haven't read the manual in enough detail to find it.

Good radio, good pricel

The FT-2500 is pretty rugged, but there are ones that are even more
sturdy. I'd say a Motorola MCX-100 or MCX-1000 is easily more rugged
than an FT-2500, and has a better receiver, too.

4237. IC745 frequncy shift/distortion problems

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-29 00:00:00 UTC
From: degreene@heurikon.com
Message-ID: <degreene.828137498@news.heurikon.com>
Source record: 203676

Hello,

I was talking to a friend ont he radio a few days ago
and noticed he was having a bad frequency shift/drift
problem. His rig is an Icom IC745. While he was
transmitting, at first I noticed a steady 100Hz/minute
downward frequncy drift that went on for about 4 minutes
steadily, then it abruptly jumped down about 2.5KHz and started
distorting very badly. Then it just jumped back to the original
frequency we had started on and the problem went away. Then
it did the same thing about 7 - 10 minutes later.

He said that this has been reported to him before, so I
assume my radio wasn't the problem.

Does anyone know what this problem might be or what
a fix might be, or perhaps a good way to start troubleshooting
it? please email me at degreene@heurikon.com

Tnx,
Dave aa9bi

Message-ID: <4jhnek$3k7@mksrv1.dseg.ti.com>
Source record: 203679

Sorry, Nate, but I gotta disagree with most of your post...

First, some background on me. I've been licensed since 1977, and have worked HF heavily all those years. I have an Extra Class license (since 1990), and I work only CW. I've never had that much fun on SSB, but playing around with 10m FM is fun (especially on homebrew gear and converted CB rigs).

I suppose I will have to agree that much of the conversation on SSB is quite boring and mundane, with a bunch of "old farts" who get together every day at the same place and time and say basically the same thing, and far too many idiots like those on 3898 KHz. HOWEVER... that's NOT the only QSOs you'll hear, if you'll tune past that garbage and really listen. There are PLENTY of nice folks on SSB if you look around the band to find them! It only takes a LITTLE effort on your part.

I love operating CW, because I find more enjoyable conversations there (my personal opinion, do not flame me in public and waste a lot of newsgroup space). Sure, a lot of QSO's end up being RST/name/QTH/rig/weather/73/CUAGN. I like to chat and rag-chew, and most of the time, I can find someone to engage in a nice long QSO. I have plenty of subjects to talk about: QRP operating; homebrewing and modifying ham gear; restoring, showing, and driving classic Ford Mustangs; die-cast model car collecting; glass insulator collecting; traveling the caribbean and going on sea cruises; et cetera.

It sounds to me, Nate, like you're really not giving HF any kind of "fair shake". As I said, on SSB, you've got to tune your rig (and your mind) past the boring old farts and nasty ignorant SOBs to find what you're really looking for, but it is out there, please trust me. As for CW, don't look at it as a hurdle to overcome, or a "lockout" to keep people off of HF. Instead, go after it as another doorway to meeting others and enjoying part of the world of ham radio. It can be fun, if you don't look at it negatively.

Now, then... if anyone wants to disagree with my opinions, and has some burning desire to flame me over anything that I've said here, please do it privately, so we don't waste a lot of newsgroup space yelling at each other. Thanks.

As for you, Nate, you've really stepped on a lot of peoples' toes with your tirade. Just back off and think about it a bit more, and give HF another chance.

73 to all from the Lone Star State! de KC5NG

>
>73 de Will KB9JTT
-SNIP-

Well said, Will. Both of these rigs are fine pieces of gear, but neither is for everyone. I own the DX-70T. I evaluated both, and applied my own criteria: cost, basic features, performance, size. I was looking for an HF mobile rig to primarily use on SSB (yeah, I know, I'm supposed to be Mister CW, but not when I'm mobiling). I enjoy yakking on 40m and 20m, and have no interest in 6m or 2m. I must have a rig with detachable front panel due to limited space in my vehicle, so the Kenwood TS-50S and Ten-Tec Scout (which I owned at the time and later sold) were not viable contenders. Both the DX-70T and IC-706 put out 100 Watts, have the detachable front panel, are about the same physical size, have LCD displays, and the same basic features (all mode, general coverage, et cetera). The DX-70T was (at the time) over $300 cheaper, and had fewer bells and whistles. That is important to me when operaing mobile, because there's already enough going on in and around a moving car, and too many radio knobs and buttons to mess with takes too much of my attention away from driving (which is a very bad thing in Dallas traffic, believe me). So, for me, the DX-70T was the better choice. I won't sit here and tell you that any of the four rigs I've noted here is or is not the right one for you. You MUST evaluate all of them and apply YOUR OWN criteria. Then buy the right rig for YOU.

73 and good luck in your rig search de KC5NG

Getting completely off the topic of HF... but, you are strange! Just by
reading your messages that you send to backup your point it scares me.
You don't get angry you just write and use strange come backs.

I don't know... strange people on here!

From: n9mxt1@aol.com
Message-ID: <4jhr31$eda@newsbf02.news.aol.com>
Source record: 203682

Hmmm reading your message was very interesting. I personally feel you
wrote the message for 1 of 2 reasons.

1) Maybe you thought the Newsgroups were becoming quiet and thought that
writing a message against HF would stir-up some activity!
2) Maybe you have nothing else to write about!?!? and thought to yourself
hmmm who can I put down today??

OK... well, theirs many aspects to the hobby and some people like HF and
others I
guess don't! Personally, I find pleasure working DX and working
contests.. I have accomplished many awards for my working stations on HF.
ie: DXCC / WAS / WAZ and more. When, I get on HF I have normal
communications with fellow hams and also have my short exchanges too. I
know people personally who hate HF only cause they are to lazy to upgrade
to have the HF privilege added to their license. So, you have a right to
hate HF but, if your justing going out and bashing the HFers like myself
you should at least write another message after upgrading from NO-CODE to
a higher class! "Just an idea!". Basically, the ending to your message
saying "I've worked my share of HF, I thus I have not upgraded" only tells
people that you did this via CB radio or your willing to operate illegal
on bands you don't have rights too. So, why should anyone care what you
think!!!! If you don't like the laws that the FCC made in this country
then maybe move to another country where you don't have these rules to
follow.
Well, I don't want to put you down or anything but you seem to have a
lot of problems on your mind so maybe you should get some help!

Have fun complaining... HFer's BEWARE of people
like this!!

After reading late in this thread, I thought I'd jump in with my two cents.

Ham rigs offer something the commercial rigs don't: Easy programming. When I'm traveling, I need to be able to punch in a repeater and use it. I've got an Icom IC-2700H as my current mobile rig, and while I think it's a piece of trash, it is convenient (I'd buy an Alinco if I had it to do over again).

But... I'm also a fan of commercial performance. I've got a couple of Syntor's stashed away that I'm planning to add the "left-coast" control units to eventually. Still, they're pretty big, and won't likely end up in my car. I'll use them as base units.

For mobiling around my county, I'm planning to purchase a couple of Motorola MaxTrac 300's (or GM300's). They're cheap ($500 new, less used), synthesized, scan, have PL, etc. They're also pretty small. Once I get some cash saved and mount these in my truck, the Icom will likely remain off most of the time. I hate it's intermod rejection (I call it my paging receiver....doesn't matter what frequency I'm on, I can hear pagers on most of them).

The MaxTracs are fairly easy to repair, and provide good performance. I don't notice intermod problems with them, and they're simple to operate.

But still...I do need the frequency agility of a ham rig now and again. Since I can't find a reasonable ham rig for performance, I'm stuck using both.

I tend to avoid rock-bound rigs, since I change my mind too frequently to buy crystals. Also, being involved with public safety, I need a few more channels than the averae ham.

I'm not sure this offers much of a solution to most (since it involves high dollars having multiple radios), but it works for me.

I have a friend that has come into some real nice Motorola
VHF equipment. She would like to know what this equipment is
worth, as she intends to sell it all.

1st. She has 6 Motorola VHF Power Amplifiers.
These are BRAND NEW in the ORIGINAL boxes. They
were obtained during the closure of an Airforce base.
They come with a Long Power Cable, and a Long coax cable.
These are all packaged as to be installed in a mobile unit
of some type. They have a TO-220 transistor driving
an RF-Power Transistor that has House markings.

Motorola #N1274A, Frequency 136-150.7 Mhz
Kit No. NLD7701A

The Amplifier is all brushed Aluminum.
2.5"H x 4.75"D x 6" W

What are these worth?
==========

Next She has Qty 3, P100 T-Band hand helds. 470-495 Mhz.

Last 1 HT90, also T-Band. Some have holsters, and all
have batteries.

What are these units worth?

Having recently done this same thing (disassembled a FT530 pack), here are some pointers:

1) remove the little label on top. There is a snap tab underneath. The case opens as a clamshell from the top. Do not try to pry it open from the bottom.

2) I didn't have any problems getting the seams apart - the primary method of keeping the pack shut is glue applied to the ends of the nicad cells inside. Basically, all that is required is enough carefully applied force.

3) I tried the "freeze it overnight" method to make the glue more brittle - it didn't seem to help much if at all, but it is worth trying.

>Sincerely,
>Lauren Schiff
>KB8WLD

This I find most peculiar. The AA packs hold 9 cells for 13.5VDC. Sounds like the salesperson is incorrect. My suggestion would be to call Bendix/King directly for confirmation of this strange statement. It should of course be noted, that alkaline batteries have a voltage drop more pronounced than do NiCads. Their current capacity is much greater of course, but you lose voltage, and therefore wattage, sooner with alkalines than with NiCads. I still prefer alkaline batteries for their greater current capacity, but use nicads for their lower cost.

Here's direct contact info on BK that may be of service:

Bendix/King Mobile Communications
2901 Lakeview Rd., Ste. 100, Lawrence, Kansas 66049
800-523-5955

From the 8/94 catalog:
EPH5101A, 14ch, numeric keypad, Lexan case, 5w, $745 w/o battery.

Buy batteries from EH Yost/Periphex or other aftermarket maker and you'll save a good $20 each, in some cases perhaps more.

Buy the LAA-0139 Replaceable Battery Holder. it's ORANGE (very SAR correct) and $2 less than the standard grey ($22 vs $24).

> Q. Is there any way of defeating this problem?

For what it's worth, the FCC in the USA specifically identifies
such cross-band links as being legal only on frequencies above 222 Mhz.

This means that it is technically illegal to have a "440 repeater" that
is being linked via a 2 meter frequency. Be warned, as I've heard
actions being handed out for these kinds of violations.

Now, when I had a TM-721A, I just tied an ider to the "mic"
connector on the front of the rig. When the rig was in crossband
repeat mode, the mic line was "hot". I just had the ID'er set up
to ID every 2 minutes and set the level to be audible but not
obnoxously loud. I didnt even have a COR to key the rig. If the
rig was keyed during one of the 2 minute identification periods, the ID
would go out over the air. I could usually get at least 2 or 3 id's
per 10 minute period, which was well within the bounds of the law (1 id
per 10 minutes).

Hope this helps....Joe

There is a free program on the sharware CD ROMs that is better than Doctor DX, especially if you have a sound card. It is called PED and it does a pretty impressive job of simulating pileups. I know the program is on the QRZ disc, and might even be in the archive on their web page (http://www.qrz.com).

I would like to sell my Motorola cellular phone system.
It has Voice recognition for dialing phone numbers from
handsfree microphone. " CALL HOME" ect. Ultimate in lazyness!
A talking response from the phone confirms action to
the phone is doing at the time.
Three watt mobile or transportable setup.
Comes with Motorola VCR training tape.
This phone has no problems and is in excellent condition.
Printout of passing all test on cell system tester included.
Best fair offer or trade for Ham Equipment.

Thanks,
Jack kovar

> All front panel buttons also dont work.
> I already try to press RESET button but also don't fix the problem.

Now I find the problem is not because of expanded receive freq.
But maybe something else. The new problem is :

When I connect a speaker (internal or external) then the rig seems 'hang'.
Dial knob still work but no button does including mic up/down button.
The rig works properly if I remove any speaker from the unit. :-(
I also try using earpiece with high impedance coil, but also can't help.

Is this called 'electro-static' problem ?
Anyone has idea for this ? I cannot fix it yet....

Thank you...

I am selling a PK-232MBX in great conditon! This TNC has Packet, Morse Code, Baudot, ASCII RTTY, WEFAX, NAVTEX, and AMTOR/SITOR will do PACTOR with upgrade. Also, has 2 ports can handle HF/VHF. 18k Mailbox inside and plenty more....

Have manuals, cables from TNC to computer, cables made up for Kenwood TS450 if you have this also have premade cable for Kenwood HT. If you have another radio I have plan cable for you to make your own cable for your exact radio. Might even have the box... will have to check though!

If interested I am selling it for $200 + shipping.

Email me at N9MXT1@AOL.COM
For more info call me at (847)824-2112 Home
(847)824-2235 Fax number

Thanks for your time and hope to hear from you
soon!

Nathan,

I figured you must be a NO-CODE LID! Only your mentality
would bash the HF spectrum. Stay on 2 meters or better yet,
channel 19, where you belong. I'll bet you use the words
"break", "destinated", "come on back" and every Q-signal in the
list on the local 2-meter repeater, even though Q-signals are
CW (morse code!) abbreviations. And before you start bashing
code as an useless out-of-date mode of communication, I have had
many wonderful conversations with stations everywhere using code,
while driving down the interstate.

So, if you don't like HF, then STAY THE HELL OUT so that we who
enjoy all aspects of amateur radio, especially HF can enjoy it.

I'll bet you give your callsign and add "for ID".

>least $50 a set. And since I have never seen any of those radios with
>"dual band" features, he's gonna need two (no room left in the trunk for
>luggage).

I suspect most hams only use a few channels, and the extra channel
capacity of most ham rigs is wasted. One would hope that he would
buy a bag of channel elements from the same source as the radio,
I usually pay a quarter a piece for them. Crystals will cost $10
of course, but that's not bad when you don't need many. The radios
are larger than most amateur radios, but the control heads are
small. You can usually find a place to mount them in the trunk that's
otherwise wasted space, so I don't think that they have to take up
important room.

>I agree that alphanumeric displays and other bells and whistles are luxury
>items that should come second to performance - and even then, I question

>some of their real value. But I think that "solid communications" can be

>get from a commercial rig. But then for $200, this guy might get what he
>wants with an amp - and depending on how he installs, it could be clean,
>neat and easy to use.

Well, yes, he could spend $400 for a used amateur dualbander, but
he'd only spend $260 for two Micors and crystals. He'd then have
two solid 80 watt radios that would serve him well for years, and
wouldn't have the IMD problems of amateur gear. I don't think an
amplified HT can compare to that. Note too that if he buys a
Syntor, there are some fellows on the left coast selling a control
head for them that gives them memories, scanning, etc, just like
the amateur rigs, but with commercial performance.

>IMO - About the only thing you gain by going to a Micor/Mitrek/Mastr type
>of radio is ruggedness. But most hams treat their radios with more care
>than the average refinery/pipeline/contruction worker, so I would go with
>frequency agility, power control, ect. My only use for commercial gear in
>ham radio is fixed stuff - repeaters, etc. - they're good for that.

The commercial gear is rugged, easy to repair, has good power, usually
excellent thermal design, and is almost IMD free (which isn't true of
very many amateur rigs), but best of all it is *cheap*. You can easily
fix it yourself if need be, but it is cheap enough that you can just
pitch it and get another if it breaks. No need to worry about warrantees,
or hassle with sending this stuff to the factory for service (not that
it is likely to need it).

The low cost (and the dents and scratches) also tend to make you more
willing to heat up the soldering gun and add modifications, something
many won't do to their shiny new Japanese rigs. There's plenty of space
inside to tuck away your ideas too. These commercial rigs are the perfect
foundation for experimenters. For example, you could fit a DDS board into
a Mastr II and have a radio just as computer agile as any Japanese box,
but with much better basic RF performance.

Perhaps this isn't the way he wants to go, but it is a good way to go,
and one more hams should consider seriously. I think too many are snared
by the slick advertising, and the unnecessary bells and whistles, and
don't really think about what they actually need in a communications
radio. So they wind up paying more than they should for a radio that
does less than they need while being layered with features that they'll
never use.

Hi George,

The problem isn't the lack of a band switch, the problem is in the amps (lack of) biasing and the basic circuit design. IMD problems will not show up on a scope, and show up only on a spectrum analyzer if the amplifier is operated with a two carrier test.

Most Palomars wouldn't operate outside the upper end of the HF spectrum. They only worked near the CB band (because the RF chokes were too small).

All of the Palomars I'm aware of won't be clean for SSB or AM linear operation. Palomar intentionally used a bias circuit (in some amps) that promoted positive carrier shift (forward modulation in CB talk).

Even if the model you have has the grids all grounded, two sweep tubes driving four is real nasty for IMD (unless the model you have happens to have all six tubes in parallel, then it's just dirty)!

I know it may not be what you want to hear, but the truth is amp you have was designed to be a CB amp. The bandswitch was a "clever" way to get around FCC rules. Palomar sold those models right before the "final FCC bust" that put them out of the illegal CB amp business permanently. They were never marketed to Hams, just CB'ers.

73, Tom

I have used a simple 1/4 wave whip with good results. It is NOT as good as the quad-filar (sp?) antenna that is supplied with the unit (GARMIN) but does work. I used it only as a test to see if the GARMIN antenna was defective.

(It was, but I had accidentally subjected it to an excessive G load. My fault.)

The signal strengths were weaker on the bar graph, but were still usable. As I remember it, the vertical was about 1 7/8 in. long.

All you purists can hit the "CANCEL" button on your learned flames. I tried it.
It worked. It is not a better antenna than a patch antenna. It is easy to make.

I also want a good active patch antenna for my GARMIN GPS 90. Where can I get one?

For starters, the RS HTX-202 has to be a premium deal for the radio you
get, usually around 189.00-209.00
HF rig? how about the new Icom 160m-10m + 6m&2m
or the Alinco DR70 10-160 meter + 6meter band. 100 watts
Both are about 1200.00
Or do what I did a find a silent key garage sale, picked up a Yaseau
FT 902 DM 100 watts... 10-160 all modes for 200.00 with all manuals and
some accessories..... good luck Rick KC7AXU

To ERASE A FT-51R MEMORY...

1. In the MR mode, Select the memory you would like to erase...

2. Press the F button for 1 second, then press the MR key.

3. The memory is now erased ! It's that simple and it's not in the
manual...

Dave,

The following may help

Gary

Most Common Failures and Cures for the Icom IC-745

Symptom: Distorted RX/TX, or no RX/TX on one or more bands.
Distorted SSB audio sounds raspy and rough. Problem may be
temperature related.
Probable Cause: Bad trimmer capacitors on PLL unit, HPL VCO
section.
Cure: Replace plastic trimmer capacitors C78, C88, C96, and
C107 with ceramic equivalents. We suggest using a 12pf
trimmer for C96 instead of a 7pf as listed in the service
manual. This will allow you to properly adjust the HPL lock
voltage for that band.
Remarks: While you have the PLL unit lifted, it would be a
good idea to inspect and rework the soldering in the

regulator section. Also, inspect electrolytic capacitors C128, C129, C132, and C137 in the regulator circuit for discoloration caused by overheating. Replace all overheated capacitors to prevent future failures.

Symptom: Frequency instability.
Probable Causes: 1) Unstable trimmer capacitor C5 on 2nd L.O. unit. 2) Dirty RIT/XIT pot and switches.
Cure: Replace plastic trimmer capacitor with a 30pf ceramic trimmer and realign. Clean dirty RIT/XIT pots and switches with Blue Showers solvent.
Remarks: Unstable C5 is very common in the IC-745. The plastic version of this capacitor should be replaced on all units that come in for repair as preventative maintenance.

Symptom: Erratic display i.e., frequency listed will be out of the normal operating range of the radio. Rotating the VFO knob may cause strange characters to appear in the display. Radio does not work properly. Cycling the power switch a few times may restore operation temporarily. Problem may be temperature related.
Probable Causes: 1) Cracked solder on RAM unit is causing logic errors. 2) Program in RAM unit is corrupted. 3) Burned/overheated R20 on logic unit is causing low voltage in logic unit.
Cure: Check for burned R20 (10 ohm, 1/2 watt) on logic unit. If it looks OK, resolder cracked joints at J1 and J2 connectors on RAM unit, then reprogram. If this does not help, substitute RAM unit with a known good one. If the substitute RAM unit works properly, then the RAM unit must be replaced.

Symptom: RX noisy and intermittent. Preamp intermittent.
Probable Causes: 1) Bad preamp relay on RF unit. 2) Cracked solder on RF unit in preamp section.
Cure: Replace bad relay RL1 (FBR221DO12). Carefully examine the preamp section of the RF unit for bad joints and resolder as needed.

Symptom: Intermittent low FM TX output power.
Probable Cause: Poor contacts in relay RL1 on FM unit.
Cure: Replace bad RL1 (221B-D009-M).

Symptom: No preamp operation. Sensitivity of radio drops when preamp is engaged.
Probable Causes: 1) Bad preamp relay on RF unit. 2) Burned components in preamp section on RF unit.
Cure: Replace bad RL1 (FBR221DO12). Replace bad/burned preamp components on RF unit, usually RL1, Q11, Q12, R58, C86, etc... Also check Q10 for failure. If bad, replace it with a 2SC2878B.

Symptom: Low, erratic TX output in all modes. ALC meter reading is unsteady and may drop out altogether. Removing the top cover may cause problem to disappear for a while. Pressing on the wiring harness near the IF unit may cause the power/ALC meter reading to fluctuate. Problem may be temperature related.
Probable Causes: 1) Poor solder joints on IF unit. 2) Dirty RF power/mic gain pot. 3) Poor connections at IF unit is causing low TX drive. [This is sometimes caused by oxidation at the point where the wires is crimped to the connector pins.] 4) Bad relay on FM unit (if installed).
Cure: Clean dirty RF power/mic gain pot. Resolder cracked and suspicious-looking joints on IF unit. If these do not help, remove and resolder the wire crimps in the RF connector pins in J2, J5, J12, J9, J19 and J20 on the IF unit. Be sure to not add too much solder to the connector pins or they will need to be replaced. Be sure all connectors are fully seated after repair. Replace RL1 on the FM unit.
Remarks: Although resoldering the connector pins is a delicate and time consuming procedure, it will save you a great deal of troubleshooting time and frustration.

Symptom: TX power marginal on some bands. ALC meter reading is low but steady, not erratic. Cannot use ALC to adjust for more power. Troubleshooting reveals that no specific stage is malfunctioning
Probable Causes: 1) TX IF needs to be aligned. 2) Modification to IF unit needs to be removed.
Cure: Set unit to 14.100, TX in RTTY mode, and adjust L8, L10 and L11 on IF unit for peak ALC meter reading. If this does not yield enough drive, remove the 220-ohm resistor on the bottom side of the IF unit directly beneath L8 and retune. Be sure to readjust power, ALC level and metering, if needed.
Remarks: If the above steps have no effect, troubleshoot for a defective TX stage, or follow steps for curing erratic TX.

Symptom: VFO tuning is erratic, sometimes skips when changing frequencies or bands. Displayed frequency does not increment smoothly when VFO knob is turned slowly.
Probable Cause: Dirty rotary encoder.
Cure: Remove white plastic cover from back of rotary encoder and spray clean the carbon track with Blue Showers solvent. Spin VFO knob vigorously while spraying.
Remarks: Do not let solvent saturate the display unit or allow it to come into contact with the plastic display lens. Stuff a paper towel between the rotary encoder and display unit to catch spray run-off.

Symptom: TX power gradually drops off when warm. ALC meter indication remains at mid-scale. Adjusting ALC does not help.
Probable Cause: APC misalignment.
Cure: Realign ALC, Ic METER, and APC as per pages 9-1 and 9-2 in the service manual.

Symptom: AC hum or buzz in transmit and receive audio when an internal power supply is installed.
Probable Cause: AC in being induced into the PLL from the AC wires and power supply case.
Cure: Twist the AC wires that run from the rear panel to the power switch and route them away from the PLL unit. Tape them up against the chassis if necessary.
Remarks: In some radios, especially older IC-745s, it is not possible to completely eliminate all AC hum when using the internal power supply.

Symptom: Drastic change in audio frequency response between USB and LSB., i.e. USB audio has too much bass while LSB audio has too much treble. TX frequency response is also poor.
Probable Causes: Misadjustment of the BFO or PBT oscillator.
Cure: Align the BFO and PBT oscillator as per page 9-4 of the service manual.

Symptom: Distorted/raspy-sounding SSB TX. Complaints of RFI. Unit tests fine on dummy load. Unit is being used with an external Astron power supply.
Probable Causes: 1) In adequate station ground. 2) External Astron power supply needs additional RF decoupling.
Cure: Recheck station ground. Improve if necessary. Install additional RF decoupling capacitors on Astron power supply.

Symptom: Noise in RX, birdies.
Probable Cause: Voltage regulators on PLL unit are oscillating.
Cure: Replace overheated C128, C129, C132 and C137 regulator filter capacitors on PLL unit.

Symptom: No receive through LB antenna jack. No BC band RX.
Probable Cause: Open DS1 fuse on RF unit.
Cure: Replace open fuse.

Symptom: 1) No RX/TX at all. Display normal. 2) No CW operation, or, 3) Some front panel controls do not operate reliably.
Probable Cause: Burned or open on R1 on reg. unit.
Cure: Replace R1 (4.7 ohm, 1/2 watt).

Symptom: TX oscillations/spurious output.
Probable Causes: 1) Bad Q10 on RF unit. 2) Open parasitic-suppression resistor on PA unit. 3) Bad electrolytic filter capacitors on PA unit. 4) Bad drivers or finals.
Cure: Disconnect J9 on the RF unit and see if the problem goes away. If it does, then Q10 is most likely bad (replace it with a 2SC2878B). If disconnecting J9 has no effect, check the value of R22 (4.7 ohms) on PA unit. This resistor may look OK but still be open. Replace C18 and/or C25 if they appear swollen or overheated. If none of the above are causing the problem and ALC meter deflection is low, then most likely the drivers or PA transistors are bad.
Remarks: Spurious output may also be caused by incorrect band switch voltage to the low-pass filter unit, or even faulty/burned components on the filter unit itself. The above causes should be ruled out first, however, since low-pass filter failures are not common in the IC-745.

4300. Problems w/ BC-210 scanner.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-30 00:00:00 UTC
From: heckers@db.erau.edu
Message-ID: <4jjlct$url@kernighan.cs.umass.edu>
Source record: 203622

Hi, I was wondering if anyone could help me out with this old BC-210 scanner. The problem is that when I am scanning the 10 channels I have programmed into it, sometimes when there is a signal on one of the channels, it will play about .2 seconds of the transmission and then continue scanning until it comes back to that channel, then it plays another .2 seconds and continues doing that until the end of the transmission. The result sounds like shit and I can't (obviously) hear the transmission. It is ANNOYING as hell because I miss soooo many transmissions like that. I tried adjusting the squelch, antanna, position, etc. with no luck. Another thing that should be taken into concideration is when I leave it on one particular channel, it will always pick up the transmission and won't "pop" or anything. I think the problem may be the scanning speed may be set too fast but I don't know how to fix it (maybe it's a crystal?)

Well, thanks for any help you can give me.

Shawn (heckers@db.erau.edu)

>I was thinking of using a heat gun to soften the glue...

Think freezer instead. Freeze the pack then rap it against a hard
surface. The glue will part. The glue they use gets brittle when
it is cold, usually much more brittle than the plastic. :-)

Message-ID: <4jjmh6$3ec@newsbf02.news.aol.com>
Source record: 203624

Hi Jim.

You are undeniably correct that the IC-775 enjoys the best specs/feature mix of the three. I could have lived with the display, but budget was my main issue. Secondary to $$ was my concern over the reported reliability issues.

Although I am well aware that the MP is too new to yet have a rep for either good reliabity or bad. I'll have to find out the hard way. No dealers claimed knowledge of any reported problems with the rig.....

Glad to hear that you have had no problems with your 775. Hopefully the dealers were right that Icom jumped on the issues and fixed them.....I would hate to see anybody spend that kind of money and then get disappointed.....

73,

Mike - WA2QIC

4308. WTD: Opinions on Ten-Tec Paragon I and II

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-30 00:00:00 UTC
From: cdorn@gpu.srv.ualberta.ca
Message-ID: <4jjtdq$16e6@pulp.ucs.ualberta.ca>
Source record: 203630

Hi,
I am interested to learn more about the Paragon I and II radios manufactured by Ten-Tec. I have read the 1988 QST review on the Paragon I and the RX looks like it put in some pretty good figures. I have been unable to locate any reviews on the Paragon II which I think was released in 1994. What are the differences between the I and the II? Are there any published reviews on the II? I know that the Omni VI is very highly regarded, and am wondering whether the Paragon just doesn't measure up against the Omni, and that's why you don't hear much about it. I notice that Ten-Tec hardly advertises it compared to the Omni. It would be helpful to hear some operator's impressions of the Paragon I or II.
Thanks,
Chris VE6RDC

I've worked several guys using these recently who had frequency
stability problems. The QSO's were on CW, and the VFO (PTO?) in the
Scout would jump around at random with a shift of about 50-100 Hz. Is
this a common problem with these rigs?

Have you measured the AC voltage at the secondary of the transformer?
What happens to the DC voltage when you load the amp? Is there
excessive ripple on the RF signal at the output?

If all the tubes are lit and DC voltages at the pins check OK, I don't
think you have a choice but to use a 'scope or other form of high
impedance RF detector.

TenTec Century 21 & 21-D (digital) are oldies but goodies...
direct conversion receivers 30w output -- smoooooth little toys

Also Century 22 -- later model / smaller I think still direct conversion. (never tried one of them but probably worth owning)

Also -- if you want to try QRP, the little MFJ single banders are very nice and you really can work almost anything you hear with 5 watts. You cant go wrong for $140 investment -- resale value @ $125 so buy one, play with it and sell it when youre tired of it at a cost of $15 to own it!

4318. How Tune Tube XMTR for QRP?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-30 00:00:00 UTC
From: mkeitz@bev.net
Message-ID: <4jk6aa$dg@solaris.cc.vt.edu>
Source record: 203640

I've just set up an old RCA all-tube commercial radio for 6 meter FM. It's a model CMF-40, built around 1957. The conversion consisted simply of removing the vibrator and supplying 60 Hz AC from a transformer from house current. (At 15 x 18 x 6" and 50 lbs, it didn't seem too bad to give up the potential for mobile or portable operation). The transmitter section uses a single 6146 with two "L" sections (series inductor and capacitor to ground) in the plate circuit. Everything tuned up well, and it works our new repeater (53.47 -1.0 MHz) just fine.

With all the transmitter tweakers adjusted to peak, it puts out about 50 W. But I only need 3 or 5 W to get to the repeater, so I'd like to turn the power down somehow. Obviously there are many ways to do that, but some of them may be better than others. Perhaps someone more experienced with tube equipment than I am could comment on which of these are best in terms of tube life, spurious emissions, etc.

* Reduce the screen voltage. This is the method I presently use, as a "Tune-Operate" switch has been provided which does exactly that. I assume the purpose of this switch is to keep the tube from conducting heavily and burning out during initial tune-up when the plate tuner may be badly misadjusted. It would seem however that the tube operates with low efficiency with the screen voltage reduced. This method does have the advantage that full power can be restored easily if needed.

* Detune the "Antenna Coupling" L-C. Can this be done so the tube "idles" into a high impedance from the plate L-C circuit, but little power reaches the antenna?

* Reduce the drive power (by detuning the grid circuit). This seems like a very bad idea, as the grid bias falls with less drive (about -40 V is supplied from the power supply, but it increases to -60 V or so with drive). That probably will make the tube draw excessive DC plate current.

* Something else I haven't though of? Rewiring the power supply so only normal B+ (275V) rather than boosted B+ (750V) reaches the plate is another possibility, but I'd rather not make that much modification.

Woaaaaah! NEVER NEVER NEVER measure the secondary of the
transformer!!!!!!!!!!!!

It's:

1) Dangerous, it can kill you quicker and easier than you ever suspect.

2.) Unnecessary! If the transformer is bad it will be TOTALLY bad. It
won't just have low voltage!

If the amp is behaving properly, I suspect a bad meter multiplier
resistor. That's the most common failure!

If the amp has loads of hum, and poor regulation (as Jack suggested), it
may be the electrolytics. But the electrolytics will almost NEVER cause
low HV while the amp is on standby!

If you own the ADMS-1 software you can edit the win.ini file area that
is titled FT-51 Programmer

The line will look like this:
allowanyfrequency=0

change it to

allowanyfrequency+1

This will open up the receive only but it opens it up from about 60Mhz
to over 500 for good reception.

Also if you own this program why not pick up the latest upgrade from my
home page.

http://www.cris.com/~lsbutler

Look for my Ham link page and it's near the bottom.

Very interesting thread. Why should anyone invest time and money into
something and give it away?

Try calling Ford, G.M. or Chrysler and asking them to send you details
on their engine control systems so you can hack them.

Call General Instruments and ask about hacking into their Video Cipher 2
system for satellites.

I'm sure you'll get the same answer from all. What's the point? You're
willing to sell the information to others after you figure it out. Isn't
that the same as selling the software? If you figure it out because
nobody will tell you, why not give the details away for free much the
same as you're asking?

I agree, the 735 is a great rig. Also I would add a Yaesu FT747 as well;
you should be able to find one for about $500. And I also have an FT470.
It is a solid, rugged radio. It's got slight intermod problems, but not
as much as some other handhelds.
Also you may want to look at the FT530 - another Yaesu dual band handheld.
They are being discontinued, and are being sold for less than $300 new
by at least one of the mail-order houses.

I have heard a number of stations (usually quite critical
of their audio) that claimed to be using studio quality
microphones and audio equalizers. My questions are twofold.
(1) Does anyone know of a source for used studio mics?
(2) What kinds of equalizers are applicable for this purpose?
eg. Can you use a stereo-type equalizer just positioned into
the audio line between the mic and the radio, or are these
also studio-grade or special application units? These guys
always have booming signals with extremely real sounding audio.
I cant go up another 100 ft, nor can I afford some of the amps
out there, but this may be a feasable and fun place to really
improve my station. Does anybody out there have any experience
in this area?

Hi. About a year and a half ago, I purchased a ICOM t21a transciever at a local hamfest. It is now out of warranty, I believe. Recently, it will not turn on, and won't display anything on the display. The green recieve light in the corner is on, but not as bright as usual. Also, there is a faint hiss from the speaker, as if the squelch were to low, however the volume and squelch controls do nothing. Nothing I do seems to have any affect, short of taking out the battery and/or disconnecting the power cable. That stops the noise, and turns off the faint green light. Any comments/suggestions would be welcome. I am in Yakima, WA, and I am not sure if there are any local dealers. If not, would you reccomend one in the Seattle area? Or, are there possibly any in the Yakima area? Thanks for any reply.

4333. Re: Kenwood 870 ,Icom 775 or YAESU FT-1000mp?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-30 00:00:00 UTC
From: mikielksit@aol.com
Message-ID: <4jiff9$mn6@newsbf02.news.aol.com>
Source record: 203698

I just ordered the FT1000MP and am waiting for it to arrive.

I considered the 870, but I wanted the sub vfo feature badly enough to knock that rig out of the box. Although I really liked the idea that PC software was included in the package. This is something Icom and Yaesu need to mimic!

That left the IC 775, and the MP. I called around for pricing on both. Aside from the fact that the IC 775 is much more expensive than the MP, I was told by several different dealers that the IC 775 was buggy. A friend reinforced this by mentioning that he had heard on the local DX repeater several hams complaining about their 775's. In this instance, the complaint was the the main VFO failed - as in broke. Three hams on the repeater reporting the exact same problem. This was very disturbing news to me relative to the price of the rig. However, I have also been told by other hams claiming knowledge of the Icom situation, that the lastest iteration of the 775 seems to have all the kinks worked out. If true, the Icom has some nice features that the MP does not. The sub receiver on the Icom is better, and you have more control over it than the MP. Another obvoius difference is the higher power output of the 775. If I recall correctly, I beleive that the DSP arrangement on the 775 is better that the MP. But both rigs also have 'normal' filtering as well - if you have any money left over the buy them.

Personaly, I don't care for the 775 display. I prefer the Yaesu display.

I chose the FT1000MP partly because the price was right for my budget, and also because I was leary of the 775 reputation for relability. Last thing I want is to spend $3000 - $4000 on a radio that doesn't work. (Hope you are listening Mr. Yaesu!). The MP has almost every feature I could want, and I expect it to remain in my shack for about as long as my first HF rig - 10 years. We'll see.....

73,

Mike

Some days ago, a gentleman posted to several newsgroups a message indicating that he was sorely vexed by a problem with his FM-25. Many people responded to his posting with comments on his choice of words. While I agree that he certainly did not use genteel language, I can't help but wonder if he ever solved the problem with the radio?

Just wondering.

Real men work QRP CW. And use DOS.

What you need is AC with a lot of amp-turns. typical commercial degaussing coil has many turns of about
number 18 wire. You can accomplish the same thing with more amps in fewer turns.
One thing that is easy to make and works in a pinch is to use one turn of number 12 wire or so.
You need lots of amps. Easy place to get them is from a soldering gun. The kind with the trigger and
loop of copper for the heating element. Remove the tip. Connect a circle of wire about a foot in
diameter. Pull the trigger when several feet away. Sweep around the CRT. Let go of the trigger when
several feet away. If you let go near the crt, you will really magnetize things.
If you get lots of pretty color patterns on the screen, it's working.
The wire can get hot enough to set things afire. Don't leave it on more than a few seconds.
Good luck.

Mike I had operated all three radios on more than one occasion at a local ham store prior to buying my radio. Immediately the TS-870 was ruled out. Reading the receiver SPECS ONLY in the reviews of all three units in QST and paying no attention to the reviewers likes/dislikes I feel the ICOM 775DSP comes out on top. I bought the ICOM 775DSP in November 1995 and have not been sorry. One other thing I personally perfer the display on the 775 vs the 1000mp.

Source record: 203707

"Macnet Roster" (ver. 739) has just been updated and is now a stand-alone application! The version number = the number of hams using Macs.

"Macnet Roster" lists:

o CALL SIGN @ HOME PBBS
o FULL NAME
o ADDRESS
o CITY, STATE, ZIP
o INTERNET ADDRESS
o MACS USED
o RADIOS USED
o SOFTWARE USED
o PASSIONS
o COMMENTS

of every known amateur radio operator in the world that uses a Mac computer.

You can use "Macnet Roster" to find other Mac users that you can then communicate with directly. Compare notes on software, applications, ideas, hints and kinks, and make new ham friends that use the same computer you do. (You already know how cool you are - imagine accessing "the rest of us"!)

If you'd like the latest "Macnet Roster":

Send me a formatted disk in a self addressed and stamped disk mailer that is in a large envelope clearly marked "ROSTER".

Or connect to my home page via the WWW

http://www.mv.com/ipusers/wd1v

Put YOUR INFO (via EMAIL or disk using TEACH TEXT) if you'd like to be included in the "Macnet Roster" or send an update to your stats to me via pkt or email anytime.

>
>1) The Weather
>2) Type of Radio
>3) Signal strength

This is true to a large extent. Its difficult to find an interesting
conversation on HF. Hopefully all the old farts will die out and a
new younger crowd will fill in. I've found 2m MUCH more interesting
to listen to than HF. No code techs will inherit the ham bands.

(I'm a tech+ at 10wpm working for my general ... not sure why)

HF does have its appeal dispite the old boring farts. Its facinating
to have to ability to talk to others in foriegn countries.

>HF offers little enjoyment to people who are more than 'postcard
>chasers'. Even CB'ers, whom HF'ers seem to think are inferior, carry on
>more interesting conversations.

I differ on this. CB doesn't require a person to be able to read, and
its evident on what you hear on CB. Seems a number of CBer's are on 80m HF.

2m hams seem the friendliest, most interesting lot. I've traveled
across the USA and has many a fascinating conversation on 2m.

>Nate's suggestion for improving HF:
>1) Instead of code, require a test in socialization & conversational skills.
>2) Allow no more than 50w 40m and below.
>3) Make it illegal to talk about root canals (noone cares!)
>4) Require a physical & hygene exam! (I get sick every time I go to a
> HamFest!)

I believe as the old farts die out the powers that be will get desperate
about probability of loosing ham bands. The code requirement will drop
for at least a few bands, and the ham community will be better for it.

>Just my thoughts. No-coders, you really aren't missing much, so if you
>can't learn code for whatever reason, don't sweat it! You can get better
>looking postcards at the corner drugstore, and you can have better
>conversations with local trees, and other vegitation.

Personally, I will struggle to 13wpm and get my general. The code
requirement may not be dropped for 5 years yet.

Some people love code, others hate it. I see code as celery.
Don't hate it, don't like it, just a painful dicipline you
must inflict on ones self to reach a goal, be it to loose
weight on a diet, or get my general lisense.

I think the die-hard code-will-never-die hams don't want the code
requirement dropped because it was so difficult for them to pass.
Things were much stricter in 1930, not to mention they had to
walk a mile in the snow with no shoes, use two pieces of wire
to crank out 20wpm under the scrutiny of stern FCC officials.

>Oh, yeah, you HF'ers are all going to look up my callsign, and to save
>you the trouble, it's KB9LSX, and I am NO-CODE. But believe me, I've
>worked my share of HF, and thus I have not upgraded.

KC5LWF here, eating celery, and learning code.

>I have a bad Nicad pack from an FT-530. If I remember correctly, tha last
>time I tried to dissassemble a Yaesu pack from a 470, it was extremely
>difficult...

Here's what I did...

1. Remove the little label/tag, only to help keep the battery looking as original as possible.

2. I wraped the battery with a soft cloth, two ply...

3. Inserted the battery into a bench-vise with the jaws across the weld.

4. I tightened the vise and smacked the seam with a cowhide mallot (I suppose a rubber mallot would work just as well)...

5. The first colpa' times it didn't break the seal/weld... so I tightened the vise just a little more at a time... then another smack or two.

***The seal/weld will crack. I've rebuilt three battery packs using this method and I recommend it highly... just don't over do it with the vise!

BTW, I used a hot-glue gun to form the cells together and resealed the case-halves together with no problems. In fact my rebuilt batteries are lasting much longer than the new one's ever did!

Lemmie' know how you like your new/almost-new/better-than-new battery pack?

Source record: 203568

In article <315DB9AD.1A03@mtnweb.com> Josh Pavlovich <jpav@mtnweb.com> writes:
> Does anyone know if this is the same case design as the FT10/40.
> Basically, I need to know if it will use the same battery. Any info
> would be great.

I don't know, but I suspect the FT-50r will use the same battery as the
FT-10r and FT-40r. Here is evidence: There are several new accessory
products for the 10 and 40 now. Here are new entries in HRO's produce list,
not yet with price assignments and not yet in stock, from the web page
generated by:
http://www.hamradio.com/cgi-bin/uncgi/ase?MAN=yae&ITEM=&DESC=&TYPE=&MAX=500&OPT=on

44) YAESU CT-27, CLONING CABLE FT-10/40 SERIES $0.00
92) YAESU FNB-42, 9.6V 1100MAH 5W BATTERY (TBA) $0.00
225) YAESU MH-37A4B, EAR-PIECE MICROPHONE FT-10/40 $0.00
265) YAESU PA-17, BATTERY CABLE EXTENDER FT-1O/40 $0.00

That battery extender could be interested, because without the battery
(and presumably with a plastic plate to put on the back of the radio)
the 10/40/50 will probably be really nice and thin. Good for hiking, maybe.

By the way, I noticed these new products from Alinco and Standard, too:
34) ALINCO DR-605T, 2M/440 MOBILE 100 MEM 9600 BAUD $0.00
1) STANDARD C5900DA, 6M/2M/440MHZ TRI BAND MOBILE $0.00

I wonder how the 605 will differ from the 610. I like the 610, with its
official, advertised remote controllability feature. (Not undocumented as
with the Kenwood TM-733A.) A built-in CW ID circuit would be good to
go along with that, though.

To me, the 220MHz, 900MHz and 1.2GHz bands would be of more interest
that the 6m band, although there is a controllable, frequency agile
6-meter remote radio on one of the repeaters around here. A few
people have Kenwood TM-742A radios with the 220MHz module installed.

4354. * * * AFFORDABLE QSL CARDS * * *

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-31 00:00:00 UTC
From: MMcanally@gnn.com
Message-ID: <4jmkgq$fa5@news-e2b.gnn.com>
Source record: 203569

After some checking, I found out that QSL cards cost anywhere from $70.00 to $450.00 per 1000 cards to be printed up. I also found out that you are pretty limited to the color of card, artwork and color of ink to choose from. I have been printing cards for my ham

friends for some time now and I have been encouraged by my friends

to branch out and advertise a little.

I can print 1000 cards with black ink for only $50.00. Why should you order your cards from me? Because $50.00 is it! No shipping charges, no setup charges, no hidden costs. PLUS...you have your choice of 13 card colors, unlimited artwork, and you can have up to FIVE different layouts per order. Want color ink? For example, do you want a red, white and blue US flag on your cards? That would only be $65.00 per 1000, with 13 card colors to choose from,

up to FIVE different layouts, and unlimited artwork in black or colors.

Your card color choices are white, blue, yellow, pink, green, ivory, peach, gray, and the following eyepopping flourescents: yellow, pink, green, blue, and red. Artwork is too numerous to list all designs here, but just some examples would be an ARRL logo, ARES logo, SKYWARN logo, flags of all 50 states, maps of all 50 states, antennas and radios, flags and maps of US territories and foreign countries and 1000's more...
Custom artwork available at NO ADDITIONAL CHARGE!!! Just tell me what you want!!!

Brian,

I have a 1270c connected to a HTX 212 and everything is working fine.
The cable that I got from MFJ was wired wrong on one pin so as soon as
I fixed that everything was fine. I would suggest that you look
closely at the radio manuals and trace the wires to the correct
connections. Best way to do this is with a VOM using the continuity
tester.

gss@scsn.net

Regarding your need for field report on the RS HTX212, It is a solid rig. Better built than many other rigs on the market. I am familiar with the functional testing and life cycle testing that each 212 goes thru. I wrote a complete review in 73 mag last year.

There are some short comings, can't store out-of-band memory, un-lite key pad. Up/down buttons work backwards, squelch won't stay locked on certain times.

In spite of these, it's a very solid rig with excellent audio, both receive and transmit.

Good luck

Don Johnson

From: louis@postoffice.ptd.net (louis)
Subject: ForSale MILITARY COMM SHELTER UNUSED REAL NICE

I acquired some military shelters that I had planed a use for, but I did not ever see the project through. I
am selling these shelters and thought you might like to check out a few photos of them. If you click on the thumb
nail you can see the larger picture in 800 x 600 resolution. The shelters are rated to block Rf frequencies
up to, I believe, 1.3GHz and at 120db of attenuation. These would make Ideal radio repair rooms. The construction of

the units are double aluminum clad over a foam core with an outer kevlar skin (Bullet resistant!). In pictures 8 and 9 you will notice that the shelter can be used with a 40 foot Wil-Burt pneumatic 9 section mast. I am selling these masts separately if desired. If you would like the shelter with out the mast I can reduce the price some what. These masts are like the ones on the news vans, except that these are built to Mil Spec and the original cost to the defense contractor was $20,000 each. Don't worry that is not my asking price.

I will sell you the mast separately for $2,500
I am asking $5,000 for a shelter with a mast, and I am asking $3,500 for a Shelter with out the mast.
If anyone would like more details, I can be reached at (717) 629-7212 ask for Louis or E-mail louis@postoffice.ptd.net

To see photos of these shelters use your web brouser and go to this URL

From: n9mxt1@aol.com (N9MXT1)
Subject: HF sucks!

Hmmm reading your message was very interesting. I personally feel you wrote the message for 1 of 2 reasons.

1) Maybe you thought the Newsgroups were becoming quiet and thought that writing a message against HF would stir-up some activity!
2) Maybe you have nothing else to write about!?!? and thought to yourself hmmm who can I put down today??

OK... well, theirs many aspects to the hobby and some people like HF and others I guess don't! Personally, I find pleasure working DX and working contests.. I have accomplished many awards for my working stations on HF. ie: DXCC / WAS / WAZ and more. When, I get on HF I have normal communications with fellow hams and also have my short exchanges too. I know people personally who hate HF only cause they are to lazy to upgrade to have the HF privilege added to their license. So, you have a right to hate HF but, if your justing going out and bashing the HFers like myself you should at least write another message after upgrading from NO-CODE to a higher class! "Just an idea!". Basically, the ending to your message saying "I've worked my share of HF, I thus I have not upgraded" only tells people that you did this via CB radio or your willing to operate illegal on bands you don't have rights too. So, why should anyone care what you think!!!! If you don't like the laws that the FCC made in this country then maybe move to another country where you don't have these rules to follow.
Well, I don't want to put you down or anything but you seem to have a lot of problems on your mind so maybe you should get some help!

Have fun complaining... HFer's BEWARE of people like
this!!

all of us No-Code losers to stay away from your precious spectrum, so
that we will not polute it with free thinking!

Good Tactic.

Nate.

Date: 29 Mar 1996 19:36:31 -0500
From: rdd@access4.digex.net (R. D. Davis)
Subject: Information about Utica 650-A transceiver needed

While sorting through some things, I came across a Utica model 650-A
transceiver that I received about 12 years ago - it wasn't working back then
, and I hadn't gotten a chance to succeed in putting it back into working

condition.

Firstly, can anyone provide me with any information about this unit, such as some specifications, etc.? There's also a Utical V-650-A 6 meter VFO with the unit.

Back when I tried to get the 650-A working, it was giving off a terrible acrid burning smell that I couldn't trace, and I was concerned that the fumes might be carcinogenic or toxic. Are the power transformers in these units likely to short out and cause such fumes (gave me a slight sore throat)?

This looks like a nice solid, well-made unit, in a nice chrome chasis, and it would be nice to at least attempt to get it working again.

Thanks very much in advance for any information that anyone can provide about this!

From: john@wd1v.mv.com (John Seney)
Subject: Mac Ham Users Group

"Macnet Roster" (ver. 739) has just been updated and is now a stand-alone application! The version number = the number of hams using Macs.

"Macnet Roster" lists:

o CALL SIGN @ HOME PBBS
o FULL NAME
o ADDRESS
o CITY, STATE, ZIP
o INTERNET ADDRESS
o MACS USED
o RADIOS USED
o SOFTWARE USED
o PASSIONS
o COMMENTS

of every known amateur radio operator in the world that uses a Mac computer.

You can use "Macnet Roster" to find other Mac users that you can then communicate with directly. Compare notes on software, applications, ideas, hints and kinks, and make new ham friends that use the same computer you do. (You already know how cool you are - imagine accessing "the rest of us"!)

If you'd like the latest "Macnet Roster":

Send me a formatted disk in a self addressed and stamped disk mailer that is in a large envelope clearly marked "ROSTER".

Or connect to my home page via the WWW

http://www.mv.com/ipusers/wd1v

Put YOUR INFO (via EMAIL or disk using TEACH TEXT) if you'd like to be included in the "Macnet Roster" or send an update to your stats to me via pkt or email anytime.

The cavities are a highly inductive load and my not present a solid 50 ohm
load to the amplifier. The circulator or isolator
presents a constant load to the tx.

From: turner@safety.ics.uci.edu (Clark Savage Turner)
Subject: TEN-TEC Omni VI

I replaced an IRCI equipped Kenwood TS 940S/AT with an OMNI VI a few months
ago. I also was able to let go of my Drake twins soon after the switch.
(silly, I know, but I needed the money, and the OMNI was the R4C equal in
everything I could see except out of band rejection.) I made some
comparisons before the move. Here are some of my basic feature comparisons:

Kenwood TS 940 * Ten Tec OMNI VI

1. Slope tuning wonderful * PBT very sharp, not as versatile as slope
for SSB

2. IRCI filters great, * Filter choices much better, quite as
nar SSB and CW (400 Hz pair) * sharp as IRCI, more of them, cheaper

3. Audio peak for CW great * No audio peak filter, digital lowpass fair

4. General coverage receive * ham band only, no big problem

5. built in AC only power supply * no built in supply, but runs on 12 vdc
good for many purposes

6. built in auto tuner * no tuner, but good final section,
I always use an external tuner anyway

7. good RF processor on SSB * audio processor, yuck

8. VBT on cw * PBT with narrow filters equal to VBT

9. 3 level attenuator * one level of attenuation

10. dual great noise blankers * one noise blanker, good

11. Very heavy unit * light, easy to move

12. stupid memory system * very good memory and menu system

13. manual notch * auto notch and manual notch, but
auto notch distorts SSB audio

14. filters dep on mode * filter choice indep of mode

15. * anx antenna switch (rcv) on front panel

16. * keyer built in, auto ID timer, better
fast VOX for SSB, bandstacking registers
and other more modern features included.

17. auto tuning rates for * static tuning rate, but set from front
band scanning from knob * panel. Can set very slow, for precise
CW tuning with narrow filters

****

Now, in general, the receivers were comparable under most circumstances. I am in an area where a local AM BCB station pushes the TS 940 meter to full scale even with the 30 db attenuator on. For 160 and 75 meters, without an antenna tuner in line, the front end of the 940 crumbles. The OMNI does maybe a bit better, but not a big difference. I always put a tuner in line to work 160 and 75. (I use a nonresonant 450 foot horizontal loop 40 feet up, it loves to pick up AM BCB. The only receiver that can handle it is my Drake R4C.)

The Kenwood 940 has more pleasant sounding receive audio on SSB with the pair of 2.7 KHz filters against the OMNI pair of 2.4's. The Ten Tec auto notch is useful, but I don't like its distortion.

In close in signal work, where big signals come up next to your weak ones, the OMNI seems to do a lot better than the 940. Not common circumstances,

and not a huge difference as far as I can tell, but enough to notice. Makes working stations much more pleasant under heavy QRM. You can REALLY TELL during a 160 meter contest in the late evening, when the CW signals commonly come in with full scale 60 db over S9 ... and you want to hear a weak one next door. You kick in a 250 Hz filter behind a 500 Hz filter behind the standard 2.4 KHz filter and tweak the PBT. It is impressive.

BOTH rigs suffered from bad gain equalization with the CW filtering. Switching in the narrowest of CW filters in either rig with a weak signal can be tough since the filters have a lot of loss. Ten Tec has an extra IF amp you can use to make up for some of the loss, but it does not cover all cases, as I have found (especially the pair of 250 Hz filters). The Kenwood with IRCI 400 Hz filters suffers the same. Not a big deal to put in a little bit of extra gain yourself in either rig though.

Overall, I still respect and love the 940. I keep an IRCI equipped Kenwood TS 440S/AT because I love the thing so much. It keeps up in 99 per cent of all situations. However, the Ten Tec OMNI just puts me over the top in good selectivity / filtering options and the 12 vdc power source, which is important to me. There are other good things about it, but these were the critical factors to my choice.

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.amateur.homebrew,alt.radio.scanner

Update on Microwave Bugging Devices - 3/28/96

0.902 - 0.928 ghz - Popular Commercial FH/DS Devices
1.710 - 1.755 ghz - DEA Audio/Video Bugs (over 1400 bugs purchased in 1995)
1.710 - 1.755 ghz - DOJ Audio/Video Bugs (.25 to .50 watts)
1.710 - 1.850 ghz - Treasury Video Surveillance Systems
2.400 - 2.484 ghz - Popular Commercial FH/DS Devices
4.635 - 4.660 ghz - Treasury Video Surveillance Systems

Most recently purchased gvt microwave surveillance gear seems to be running between 900mhz to 5ghz, with a few systems operating on the 7/8 ghz bands.

Also, keep in mind that the pros love to use ultra low power devices which use the power lines as the transmission medium/antenna (9khz to 300 mhz). Devices typically operate below 10mw, often below 1mw. The devices typically use Wide FM and use voice inversion encryption... VERY easy to demodulate.

Note: According to a recently obtained DOJ surveillance training manual:

"The typical range for the 28 ghz devices is six miles, the typical range of the 2.4 ghz is thirty miles, and the typical range for the 1.7ghz is 44 miles."

"... frequency modulated applications should operate below 3 ghz to take advantage of the favorable frequency propagation characteristics of that part of the spectrum."

"...Frequency Hopping and Direct Sequence Devices spead spectrum devices should operate above 1.5 ghz, this will prevent the emissions from being detected by electronic countermeasures."

4367. What to Buy? Need mobile rig advice...

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-31 00:00:00 UTC
From: Jonnycat <jonnycat@sover.net>
Message-ID: <315F4657.5E7@sover.net>
Source record: 203582

Hi-

Looking for advice. I have been using a Kenwood HT as a mobile rig in my truck via 12V cord and magmount antenna hookup, and it doesn't work for me.

Would like to buy a mobile rig that is very well built, as I spend lots of time off-road and bouncing around, and has good price-to-features ratio. Important to me are power output, alphanumeric, and ease of use.

Any suggestions?

Thanks,
Jon N1UHH

In article <4jk6aa$dg@solaris.cc.vt.edu>, mkeitz@bev.net says...

>I've just set up an old RCA all-tube commercial radio for 6 meter FM.

>transmitter section uses a single 6146 with two "L" sections (series
>inductor and capacitor to ground) in the plate circuit. Everything
>tuned up well, and it works our new repeater (53.47 -1.0 MHz) just
fine.

>With all the transmitter tweakers adjusted to peak, it puts out about
>50 W. But I only need 3 or 5 W to get to the repeater, so I'd like
>to turn the power down somehow. Obviously there are many ways to do
>that, but some of them may be better than others. Perhaps someone more
>experienced with tube equipment than I am could comment on which of
these
>are best in terms of tube life, spurious emissions, etc.
>
>* Reduce the screen voltage. This is the method I presently use, as a
>"Tune-Operate" switch has been provided which does exactly that. I
>assume the purpose of this switch is to keep the tube from conducting
>heavily and burning out during initial tune-up when the plate tuner may
>be badly misadjusted. It would seem however that the tube operates
with
>low efficiency with the screen voltage reduced. This method does have
>the advantage that full power can be restored easily if needed.

35 years ago a popular (cheap) method of AM modulating the 6146 was to
modulate the screen grid by reducing the DC screen supply and adding an
audio signal. There was no concern then for reduced life or spurious
emmisions and I doubt that we know much more about that tube now than we
did then. Seens like a good and simple approach - stick with it. 73,

Stan

Anybody contemplating insurance on their ham gear should first ask
their Homeowner's Insurance agent if they are already covered. I am
already covered on everything in the house, at no additional cost.
Lightning took out a couple of thousand dollars worth of ham gear here
a few years ago. Allstate repaired the pieces not completely fried,
and purchased new stuff for the rest, with no depreciation (all were
current models). I only paid my deductible.

I think additional insurance might be wise for mobile rigs, but even
there, I would consult the car's insurance agent first - might be
possible to get an inexpensive rider with specific coverage for mobile
rig also.

We should remember one very important thing about insurance: ON
AVERAGE, WE GET BACK LESS THAN WE PUT IN.

Don't buy more than you actually need.

I recently bought a new FT530 from the local dealer but can't find a source for the coax plug used to power this HT from an external DC supply. As usual the manual doesn't provide the spec, all it says is either a 3.7mm or 4.0mm plug (depending on where you look in the manual) but the inside diameter is not specified. All the usual local sources don't have anything that will fit.
What size is it really???
Any help would be appreciated.

RCA WT-100A and/or Hickok 700 tube tester wanted. Seeking unit in good running condition, needing some repairs or for parts (if I later come across a working unit). Willing to swap for something or please state a fair price for the respective unit. I would prefer swapping something as cash is tight, but I would have to find out what you are looking for -- I may have it. Please indicate if you have manuals, schematics, charts and/or plug-in tube sockets for the respective tube tester.

Kindly, email with details.

Thank you.

4380. Can anybody help me on a articel in '73 magazine' march 1991.

Hello,

Can somebody help me on this article in '73 magazine' in march 1991.

March 1991, '73 Magazine' has an article by John Hoots on page 12
with a description of modifications that can be made to some scanners
to improve the I.F. bandwidth.

I live in europe and i'm not able to catch up some articles or buy
one!!

I hope there is someone who will help me on this.

Can someone make a few copy of this article and send it to:

Geert Pirens, ONL2057
Flekeleerstraat 54
B-3600 GENK
BELGIUM

Greatfule thanks!!!!

4382. MFJ1270C - HTX212 Problems

Newsgroup: rec.radio.amateur.equipment
Date: 1996-03-31 00:00:00 UTC
From: Brian Webb <102670.1206@CompuServe.COM>
Message-ID: <4jkupliem1@mhade.production.compuserve.com>
Source record: 203660
Cross-posted to:
aus.radio.amateur.digital,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,sanet.radio.packet,alt.radio.digital

I own an MFJ1270C packet TNC. I've tried interfacing it with two radios with no luck.

I connected it to an HTX202 HT and I had good receive, but no transmit. I used an MFJ premade cable and a homebrew cable with the same problem.

Yesterday I tried connecting this TNC to a Radio Shack HTX212 mobile radio. Same problem: Good packet reception, but couldn't key my radio (I was doing the CALIBRA K transmit level adjustment procedure).

I removed jumper L as suggested by MFJ and I also removed a 4.7 K ohm resistor that I had hooked in parallel with R140 in my earlier attempt to use my HT.

Any idea what is going on here?

Regards,

Brian Webb, KD6NRP
